1. User Guidance

Read the User Manual in its entirety and do not use the product unless you have understood the User Manual.

1.1 Warnings

Structure of the warnings

Warnings are structured as follows:

 SIGNAL WORD	Nature and source of the danger. Consequences in the event of non-observance. Actions to avoid the danger.
--	---

Types of warnings

Warnings are distinguished by the type of danger they are warning against:

 DANGER!	Warns of an immediately impending danger that can result in death or serious injuries when not avoided.
---	---

 WARNING!	Warns of a potentially dangerous situation that can result in death or serious injuries when not avoided.
---	---

 CAUTION!	Warns of a potentially dangerous situation that can result in fairly serious or light injuries when not avoided.
---	--

NOTICE:	Warns of a potentially dangerous situation that if not avoided could result in material or environmental damage.
----------------	--

1.2 Tips

Tips on the appropriate device use and recommendations.

1.4 Scope of Delivery

- WinConfig Software, available on FTP: ftp://a-eberle-user:eberle@ftp.a-eberle.de/public/SCADA/WinConfig_11/ or at the Download Centre of our Homepage: <http://www.a-eberle.de>
- User Manual
- RS232 cable
- RPL Loader Software, available on FTP: [ftp://a-eberle-user:eberle@ftp.a-eberle.de/public/SCADA/REG-PE\(X\)-Loader/](ftp://a-eberle-user:eberle@ftp.a-eberle.de/public/SCADA/REG-PE(X)-Loader/)

2. Supported Software

Table 1: Topical software state at the 2017-11-27

Name	Definitions	
Date	27.11.2017	
REG-PE version TK860	Supported XML settings from WinConfig	
Settings can be found in directory /mnt/jffs2/param	XML settings file	settings.xml
	other files and directories are only temporary generated from settings.xml after each restart	
Images:	Firmware ramdisk: uRamdisk (BusyBox, common libraries and utilities)	
	Kernel: kernel.tgz (Linux kernel for TK860)	
	TK860_DNP3.tgz TK860_IEC104.tgz TK860_IEC103.tgz TK860_IEC101.tgz TK860_MODBUS.tgz TK860_CSO.tgz TK860_C37118.tgz TK860_IEC61850.tgz TK860_DDAKO.tgz TK860_SPABUS.tgz (protocol specific applications and web pages)	

Name	Definitions	
Date	27.11.2017	
REG-PED version TK885	Supported XML settings from WinConfig	
Settings set in directory /mnt/jffs2/param	XML settings file	settings.xml
	others files and directories are only temporary generated after each start from settings.xml	
Images:	Firmware ramdisk: uRamdisk (BusyBox, common libraries and utilities)	
	Kernel: kernel_16MB.tgz kernel_16MB_SCC4.tgz kernel_32MB.tgz kernel_32MB_SCC4.tgz (Linux kernel for TK885D board with 16 and 32 MB flash)	
	TK885_DNP3.tgz TK885_IEC104.tgz TK885_IEC103.tgz TK885_IEC101.tgz TK885_MODBUS.tgz TK885_CSO.tgz TK885_C37118.tgz TK885_IEC61850.tgz TK885_SPABUS.tgz (protocol specific applications and web pages)	

REG-PED version TK102	Supported XML settings from WinConfig	
Settings set in directory /data/param	XML settings file	settings.xml
	others files and directories are only temporary generated after each start from settings.xml	
Images:	System firmware image: System.fit (kernel, BusyBox, common libraries and utilities)	
	TK102_CSO.tgz TK102_DNP3.tgz TK102_IEC101.tgz TK102_IEC103.tgz TK102_IEC104.tgz TK102_IEC61850.tgz TK102_MODBUS.tgz (protocol specific applications and web pages)	

We take care of it.

REG-PE version TK28-4	Supported XML settings from WinConfig	
Settings set in directory /data/param	XML settings file	settings.xml
	others files and directories are only temporary generated after each start from set- tings.xml	
Images:	System firmware image: System.fit (kernel, BusyBox, common libraries and utilities)	
	TK28-4_CS0.tgz TK28-4_DNP3.tgz TK28-4_IEC101.tgz TK28-4_IEC103.tgz TK28-4_IEC104.tgz TK28-4_IEC61850.tgz TK28-4_MODBUS.tgz	

REG-PE version TK28-6	Supported XML settings from WinConfig	
Settings can be found in directory /mnt/jffs2/param	XML settings file	settings.xml
	other files and directories are only temporary generated from settings.xml after each restart	
Images:	Firmware ramdisk: uRamdisk (BusyBox, common libraries and utilities)	
	Kernel: kernel.tgz (Linux kernel for TK28-6)	
	TK28-6_CSO.tgz TK28-6_DNP3.tgz TK28-6_IEC101.tgz TK28-6_IEC103.tgz TK28-6_IEC104.tgz TK28-6_IEC61850.tgz TK28-6_MODBUS.tgz (protocol specific applications and web pages)	

REG-P version TK28-8	Supported XML settings from WinConfig	
Settings set in directory /data/param	XML settings file	settings.xml
	others files and directories are only temporary generated after each start from settings.xml	
Images:	System firmware image: System.fit (kernel, BusyBox, common libraries and utilities)	
	TK28-8_CSO.tgz

3. Introduction

The *User instruction manual* is focused to the configuration of telecontrol boards REG-P / REG-PE / REG-PED / PQI-DA using DNP3, IEC101, IEC103, IEC104, Modbus, 61850, C37.118 communication protocols and Ethernet/COM in connection with XXXSys™ devices (e.g. REGSys™ or EORSys devices) of a.eberle company. For security and other information see the *Administrator manual*.

To understand the ideas and techniques described, you should already be familiar with general concepts concerning the above stated protocols and serial communication settings.

Two methods of configuration may be used: either “online” with connection to the REG-PE, REG-PED and TK28-8, or “offline” using a PC-tool called WinConfig Tools.

The web server is a permanent part of the firmware of the REG-PE / REG-PED devices and requires no special installation.

Web server is also part of the WinConfig offline version.

4. Glossary

Combo-Box	A text box combined with a List Box within a software program
FTP	File Transfer Protocol
Group-box	A named rounded box typically enclosing a group of one or more buttons

IOA	Information Object Address
SCADA	Supervisory Control And Data Acquisition
VM	Virtual Machine
TSDU	Telegram Service Data Unit
XML	Extensible Markup Language

5. WinConfig REG-P / REG-PE / REG-PED /REG-PEDSV

5.1 WinConfig Software introduction

WinConfig is software for managing of firmware and communication protocol settings of telecontrol boards and modules: REG-P / REG-PE / REG-PED / REG-PEDSV placed into a.eberle device racks. WinConfig is a web-based program for creation and management of files containing protocol settings, for two way transfer of settings and firmware from a user PC to REG-P / REG-PE / REG-PED / REG-PEDSV boards and modules, and for identification of REG-P / REG-PE / REG-PED / REG-PEDSV devices connected to the network.

Telecontrol board firmware has to be equipped with COM-Server to identify itself within the network. COM-Server is part of all IEC101, IEC103, and IEC104 protocols installed as firmware and accessible by the WinConfig environment. COM-Server cannot work in TK519 and TK509 REG-P types, because Ethernet connections are not available with these board types.

WinConfig program equipment consists of web server Mohican equipped with active pages for GUI and libraries developed in C# .NET software development environment for communication with telecontrol boards, file services and additional auxiliary functions.

WinConfig prepares settings for REG-P / REG-PE / REG-PED / REG-PEDSV with IEC101, IEC103, IEC104, DNP3 , Modbus, C37118 and IEC61850 protocols and COM-Server on a local host (local web server) and stores them in a standard file format - .XML file. The settings file can then be transferred via HTTPS to board flash memory in the case of board types containing Linux. WinConfig creates binary data files in Intel HEX format and transfers them into the board memory in the case of non-Linux boards. Serial transfer via a.eberle device or Ethernet transfer can be used according to the REG-P type.

A part of configuration software is also transferred to the telecontrol board and this *online* part provides a system functions focused to the management of telecontrol board system software, user management etc. with high level of security. The functionality of this part of WinConfig is described in the Administrator manual.

WinConfig splits into two main parts: the local web server and the local Web site with application libraries. Settings may be prepared, stored and retrieved for various configurations without a direct link to the device.

Settings are saved in .xml file types. WinConfig launches a local web server and a default web browser on your PC.

Should one of the expressions used in this document be unclear to you, you may refer to the glossary chapter for an explanation of it. Otherwise please feel free to contact us with your technical questions at this email address: info@a-eberle.de.

5.2 REG-PEX Loader software

The REG-PEX loader (RPL) is software tool for transfer of Linux Kernel and RAM disk into the REG-PE(D) and PQI-DA telecontrol boards equipped only with U-Boot software. Such boards cannot cooperate directly with WinConfig. The RPL also allows change of board IP settings and selection of kernel with/without the bonding feature.

NOTICE:

The RPL is low-level software tool and should be used by advanced users only.

The RPL software is contained in the WinConfig installation package and can be launched from *Transfer from PC* page by the *Run RPL* button. The WinConfig also offers launch of RPL in the case when no REG-PE(D) telecontrol board is detected.

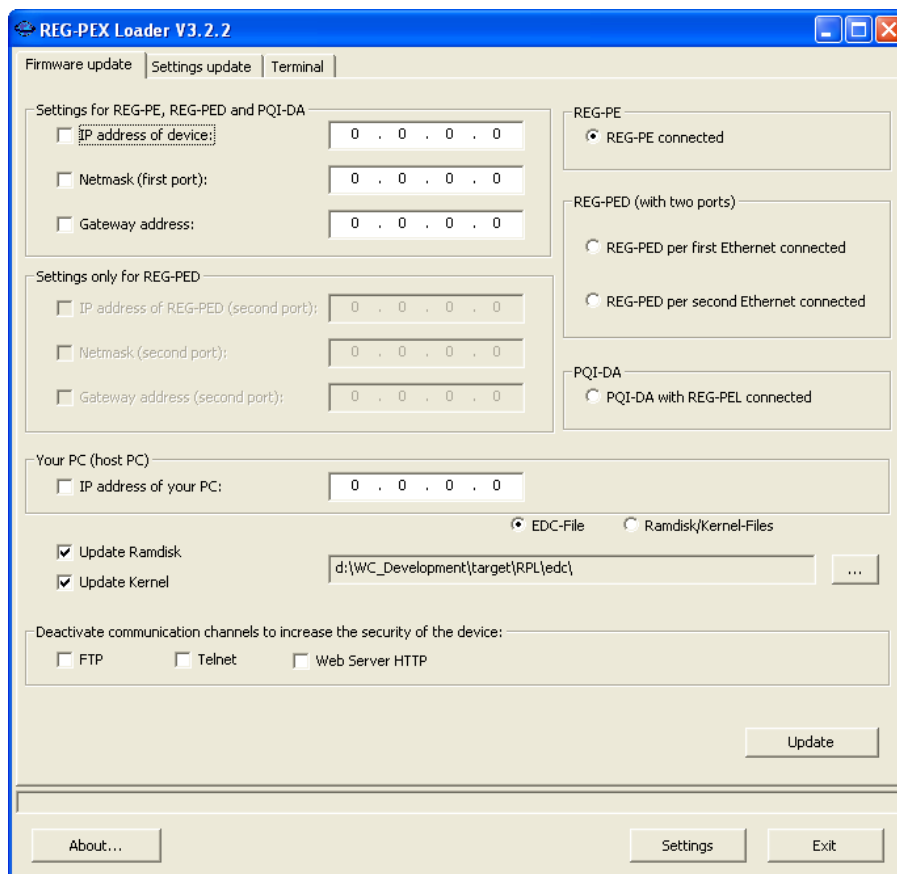

Figure 1: The RPL window

To transfer Linux Kernel and RAM disk into the REG-PE(x) follow these steps:

- ➡ Connect the PARAM connector of REG-PE(x) board and your computer with the RS232 cable supplied with the eberle device or with any serial null modem cable.
- ➡ Connect your computer and the REG-PE(x) board by Ethernet cable. Some Ethernet adapters do not switch to the correct mode automatically, so please use preferably a crosslink patch cable.
- ➡ Fill the IP address lines in RPL window.
- ➡ Use the (...) button to browse the edc file placed in the WinConfig installation folders. There are two edc files distributed in the WinConfig setup, the difference is in the versions of Kernel - with/without support of bonding. Select whatever of the two files as bonding and related features can be set later using the *Change of IP settings for REG-PE(D) telecontrol boards* WinConfig function.
- ➡ Press the *Update* button. The update process can be seen in the RPL tab *Terminal*.

5.3 Communication with REG-PE(D) telecontrol board in WinConfig 13

A higher level of security for data transfer and communication with REG-PE(D) telecontrol board is used in WinConfig v.13. The online WinConfig (www pages placed in the board memory) can be disabled in the *Transfer settings from PC* page in offline WinConfig or in the *REG-PE(D) board IP settings* page in online WinConfig or in user menu.

The new firmware supports several functions as described below.

The following secured communication technologies are used in WinConfig 13:

- 0 SFTP (SSH file transfer protocol) replaced the online WinConfig. The v.11 firmware supports several functions focused to file transfer. The file transfer via SFTP protocol is encrypted and protected by user login and password; *remoteuser* login can be used with *remoteuser* password (factory default).
- 0 SSH is used instead of former telnet for remote access to console. This access is typically used for basic board configuration. A SSH client (e.g. PUTTY) is necessary for this type of connection.
- 0 HTTPS (HTTP over SSL) together with SSL certificates is used for communication between off-line WinConfig and telecontrol board.

Note on HTTPS accounts functionality when upgrading/downgrading from/to WinConfig 10

When user upgrades from WinConfig 10 to 13 using offline WinConfig, one of the HTTPS accounts (username and password) from version 10 (passwords coded by XOR, not by SHA2 hash) is used. The accounts defined in the version 10 coded by XOR remain in the upgraded version 13. The individual account is changed to the new SHA2 coding version in the moment when user changes this account in the WinConfig 13.

The file with SHA2 coded accounts remains in the telecontrol board when downgrading from version 13 to version 10. Offline WinConfig 10 using XOR password coding will not work in such case. To solve such situation, the user can change the accounts using FTP or serial PARAM port or to delete the account file `/mnt/jffs2/config/webs_users.conf`. When the file is deleted, the default account will be used.

5.3.1 SFTP access

A SFTP (SSH file transfer protocol) client program has to be used for connection with telecontrol board and for transfer of files between board and PC computer, e.g. WinSCP for MS Windows, GFTP for MS Windows and Linux or, possibly, SFTP (PSFTP) for the command line mode.

The following files can be found in the board memory and transferred to PC:

- 0 current XML settings
- 0 ICD file for 61850 protocol
- 0 files with information about hardware, SW version, system kernel log etc.

The XML settings and ICD file are placed in the `/xload/actual` folder and files with information about HW etc. are placed in the folder `/xload/info`.

The XML settings and ICD file can be replaced and thus new configuration can be installed using SFTP. It is also possible to transfer SSL certificates with key that are used for HTTPS communication with WinConfig or to change debugging (logging) parameters as defined in the *Supervisory* page of WinConfig. The debugging (logging) parameters can be changed without need of board restart. However, the most of parameter changes require restart of board that can be also done via SFTP.

Use always the `/xload/new` folder when transferring files from PC to board. The `/xload/new` folder is scanned by firmware approximately every 20 seconds and firmware starts required action in the case when relevant files are found in the folder.

5.3.2 Actions supported by firmware and their usage:

Restart of board

- Prepare empty file named *reboot* and copy it in the */xload/new* folder.
- Wait approx. 20 s for the automatic restart of board.

Installation of new XML settings and ICD file

- Prepare new settings file named *settings.xml* and copy it in the */xload/new* folder.
- Prepare new ICD file (if ICD change is required) and copy it to the folder.
- Prepare empty file named *move* and copy it.
- Wait approx. 20 s for the automatic move and installation of the files.
- Prepare empty file named *reload* and copy it.
- Wait approx. 20 s for the automatic reload of files transferred in the previous sequence.

Reload can be used if there was change in the supervisory parameters only. Otherwise use *restart*, see item.

5.3.3 SSH access

SSH is used for remote access to console. The file transfer is encrypted and protected by user login and password; *remoteuser* login can be used with *remoteuser* password.

The access is driven by sequence of user menu that allow user to show and/or change the board settings of to show logs of kernel, system and applications.

5.3.3.1 Menu and meaning of individual items:

The configuration of menu depends on the logged user and his rights.

Main menu

- 1) Network menu
 - ➡ *Go to menu for network setting and diagnostic*
- 2) Services menu
 - ➡ *Go to menu administration of network services (SSH/SFTP, HTTPS)*
- 3) Log menu
 - ➡ *Go to menu showing logs*
- 4) Change terminal password
 - ➡ *Change of SSH and SFTP passwords. Change is applied to the currently logged user. Program asks for entering of old password and two times new password.*

NOTICE:	<i>Attention, a change is applied immediately.</i>
----------------	--

- 5) HTTPS users management
 - ➡ *Go to administration of HTTPS users (off-line WinConfig)*
- 6) Logout
 - ➡ *Terminal logout*
- 7) Reboot
 - ➡ *Restart telecontrol board*
- 8) Recovery menu
 - ➡ *Go to recovery mode. This menu item is shown only in the case of access via local serial port. Another condition is that the board has to be prepared for the recovery mode (the R key is pressed in the moment or recovery notification during the card restart).*
- 9) Start root shell
 - ➡ *The root shell is determined only for administrators and is not available for remoteuser and localuser.*

Network menu

1) Ping ICMP

➡ *The ICMP ping is determined for the diagnostic of network connection. The system asks for counterparty IP. The ICMP echo-request packet is used. The user network interface is determined by routing table.*

2) Ping ARP

➡ *The ARP ping is determined for the diagnostic of network connection within one subnet. The system asks for counterparty IP and, if there is more network interfaces (TK885), it asks also for the interface to be used. This ping usually passes through firewall. The ARP protocol is not routed to other networks.*

3) Show routing table

➡ *Shows current routing table.*

4) Show interfaces

➡ *Shows current list of network interfaces with parameters (IP address, mask, MAC address and statistics of sent and received data).*

5) Show saved network parameters (IP addresses, bonding)

➡ *Shows network parameters (IP address, mask, gateway, state of bonding) saved in the flash memory. These parameters will be used after board restart.*

6) Set network parameters (IP addresses, bonding)

➡ *Setting of network parameters (IP address, mask, gateway, state of bonding) solved as a series of questions and answers. Possible options of bonding parameters:*

1. Disabled
2. PRP V1
3. Broadcast mode
4. Bridge with RSTP

7) Back

➡ *Go to main menu.*

Services menu

- 1) Services state
 - ➡ *Shows the state of SSH/SFTP and HTTPS services (enabled or disabled).*
- 2) Enable SSH/SFTP
 - ➡ *Enables SSH/SFTP service. The change takes effect after board restart.*
- 3) Disable SSH/SFTP
 - ➡ *Disables SSH/SFTP service. The change takes effect after board restart.*
- 4) Enable WinConfig (https, network detect)
 - ➡ *Enables services necessary for the communication with off-line WinConfig. The change takes effect after board restart.*
- 5) Disable WinConfig (https, network detect)
 - ➡ *Disables services necessary for the communication with off-line WinConfig. The change takes effect after board restart.*
- 6) Enable WinConfig WWW pages
 - ➡ *Enables WinConfig WWW pages.*
- 7) Disable WinConfig WWW pages
 - ➡ *Disables WinConfig WWW pages.*
- 8) Back
 - ➡ *Go to main menu.*

NOTICE:

Attention:

When both SSH/SFTP and HTTPS accesses are disabled, it is not possible to connect the board remotely. The local access via PARAM port only is possible in such case.

Log menu

- 1) Application and system log
 - ➡ *Shows log with messages from system and from user applications.*
- 2) Kernel log
 - ➡ *Shows log with messages from system kernel.*
- 3) Back
 - ➡ *Go to main menu.*

HTTPS users management menu

- 1) List users
 - ➡ *Shows list of user accounts for HTTPS service (users of off-line WinConfig).*
- 2) Change user password
 - ➡ *Changes user password. The service asks for old password and two time for the new password. The change takes effect after board restart.*
- 3) Add new user
 - ➡ *Adds a new user account. The service asks for new account name and two times password. The change takes effect after board restart.*
- 4) Delete user
 - ➡ *Deletes existing user account. The service asks for existing user account name. The change takes effect after board restart.*
- 5) Back
 - ➡ *Go to main menu.*

Recovery menu

- 1) Reboot and format applications part of firmware
 - ➡ *Sets the formatting flag and performs board reset. Attention, this service formats the jffs2 area without possibility of recovery. This service is determined for emergency situations only, when the board stuck and there is no other possibility of fix. The off-line WinConfig can be consequently used for transfer of new firmware.*
- 2) Back
 - ➡ *Go to main menu.*

5.4 Communication with telecontrol boards type TK28x and TK102

Communication with these board types utilizes special security measures using Radius and Active Directory. For more information see Administrator manual.

5.5 Time synchronization

Time synchronization methods available for telecontrol boards and communication protocols consist of the following possibilities and options:

- ☐ synchronization by communication protocol
- ☐ synchronization using NTP server
- ☐ synchronization using Precision Time Protocol (PTP)

5.5.1 Synchronization by communication protocol

If the communication protocol used in telecontrol board allows time synchronization messages then such option is available in protocol parameters.

Protocols with time synchronization availability: DNP3, IEC101, IEC103

5.5.2 Synchronization using NTP (Network Time Protocol) server

Synchronization using NTP server is available in the case Ethernet protocols:

IEC104, MODBUS, IEC61850, C37.118. The IEC61850 and C37.118 has also DCF77 synchronization available in certain cases.

5.5.3 Synchronization using PTP

The time synchronization using PTP is implemented for the boards type TK28x and TK102. The default configuration file is prepared to set up the profile according to the standard IEEE P37.238, PTP Power Profile. The characteristic properties of this profile are set this way:

- ☐ Slave only, one-step
- ☐ Delay Mechanism: Peer-to-Peer
- ☐ Transport Mechanism: Layer 2
- ☐ PTP Domain: 0
- ☐ Sync Interval: 1s (= 2⁰ s)
- ☐ Min pdelay request interval: 1s (= 2⁰ s)
- ☐ Announce Interval: 1s (= 2⁰ s)
- ☐ Announce receipt timeout: 3s

0 Priority 1: 255 (Slave clock)

0 Priority 2: 255 (Slave clock)

The PTP parameters are available in the Time synchronization settings for the above mentioned boards and network protocols.

For more information about PTP see the IEEE 1588 standard.

5.5.3.1 Reported status of PTP

The current PTP status can be shown in the *Time synchronization* tree branch.

PTP status

Port state:	LISTENING
Delay measurement mode:	2
Peer mean path delay [ns]:	0
Offset from Master [ns]:	0.0
Grandmaster identity:	00d093.ffe.3c716e
Grandmaster clock class:	255
Grandmaster clock accuracy:	0xfe
Accuracy of clock:	0xfe
Clock status:	false

Refresh

Figure 2: PTP status

Table 3: Port states

State	Description
slave	Configures the 1588v2 interface to be in the slave state. That is, the 1588v2 device keeps track of external time information. There can be only one slave port in a 1588v2 device.
passive	Configures the 1588v2 interface to be in the passive state. That is, the 1588v2 device neither keeps track of external time information, nor advertises time information. The port shall not place any messages on its communication path except for Pdelay_Req, Pdelay_Resp, Pdelay_Resp_Follow_Up, or signaling messages, or management messages that are a required response to another management message. If more than one master ports have been detected in the domain, the best one will be selected to be master. The corresponding local port will be slave, and other local ports will be passive to backup for slave ports.
master	Configures the 1588v2 interface to be in the master state. That is, the 1588v2 device advertises time information to other devices.

State	Description
premaster	Configures the 1588v2 interface to be in the premaster state. The port shall not place any messages on its communication path except for Pdelay_Req, Pdelay_Resp, Pdelay_Resp_Follow_Up, or signaling messages, or management messages that are a required response to another management message.
listening	Configures the 1588v2 interface to be in the listening state. That is, the 1588v2 device neither keeps track of external time information, nor advertises time information. (If a device originally functioning as a master clock is configured to be an OC working in slave-only mode, or if the device becomes faulty, the status of the 1588v2 interface on the device changes from master to listening.)
faulty	Indicates that the 1588v2 interface is Down. The port shall not place any messages on its communication path except for response messages to some management messages.
disabled	Configures the 1588v2 interface to be in the disabled state. The port shall not place any messages on its communication path. A port in this state shall discard all received 1588v2 messages except for management messages.
initializing	Configures the 1588v2 interface to be in the initializing state. While a port is in the initializing state, the port initializes its data sets, hardware, and communication facilities. No port of the clock shall place any 1588v2 messages on its communication path.

The desired PTP port state when the PTP is switched ON and correctly synchronized is **slave**. Other states that can appear indicate other than synchronized state.

6. Serial ports assignment

The Serial ports assignment tree branch is tool for management of telecontrol board serial ports for boards type TK860 and newer. The serial ports available in telecontrol board are well-arranged in table together with the information about their usage in protocols and COM-Server channels. The page contains also internal checks to avoid conflicts in usage of COM ports. At the same time, the table also allows to switch ON/OFF individual protocols or COM-Server channels.

The assignment of serial ports differs for telecontrol boards type TK28x and TK102 due to addition of WebREG functionality.

Serial Ports Settings

Confirm
Reset

Enabled	Usage	Port	TCP port
<input checked="" type="checkbox"/>	Internal device interface	COM2 ▼	
<input type="checkbox"/>	CSE serial port	COM3 ▼

7. Supported protocols and telecontrol board types

Table 5: Supported protocols and telecontrol board types

Telecontrol board types	Available protocols	Protocols Accessible via
REG-PE(D) (TK860, TK885)	IEC104; DNP3; Modbus; IEC103; IEC61850; ComServer only (CSO); C37.118, SPA-BUS	
PQI-DA(TK885-1)	CSO, IEC61850, IEC104, IEC104	
REG-P (TK509, TK517)	IEC101 balanced; unbalanced; IEC103, DNP3	Serial (Write only)
REG-P (TK400)	IEC101 balanced, unbalanced; IEC103; DNP3; CSO	Serial *(Write only) and Com Server (Read and Write)
REG-P (TK28-4)	CSO DNP3 IEC101 IEC103 IEC104 IEC61850 MODBUS	Serial *(Write only) and COM-Server (Read and Write)
REG-PE (TK28-6)	CSO DNP3 IEC101 IEC103 IEC104 IEC61850 MODBUS	
REG-PE (TK28-8)	CSO	

Telecontrol board types	Available protocols	Protocols Accessible via
REG-PEDSV (TK102)	CSO DNP3 IEC101 IEC103 IEC104 IEC61850 MODBUS	
PQI-DA (TK400)	CSO	Serial *(Write only) and COM-Server (Read and Write)

Further protocols can be implemented on demand, please contact: info@a-eberle.de.

8. Introductory window

The following introductory window should appear on your screen after WinConfig is started. The following user actions are available from this screen:

- 0 Select WinConfig language from the combo box in the upper right corner of the window.
- 0 Run the standard setting and data transfer wizard from the *Step-by-Step* button.
- 0 Run complete WinConfig from the *Advanced* button.
- 0 Quit WinConfig using the *Quit* button.

Figure 5: Introductory window

NOTICE:

Important note:

If user tries to run WinConfig from read-only medium (CD, DVD), a warning message appears instead of the introductory window.

9. Work with protocol settings

WinConfig can be used for creation and modification of communication protocol settings. If the settings file was created by a previous version of generator (e.g. GenReg, INI file) then WinConfig can be used also for conversion of INI file to the XML file of settings used by WinConfig.

The communication protocol settings file can be transferred into the memory of the telecontrol board. WinConfig always appends corresponding firmware code to the settings thus the matching pair of settings and code is always transferred as a pair.

The user can also read the settings from the telecontrol boards and show the settings in the WinConfig window using the transfer to PC function. This function is not available for TK509 telecontrol boards.

9.1 Settings tree

WinConfig can have more than one settings open; all settings are shown in tree structure in the left frame of WinConfig window.

The selected settings have an orange background.

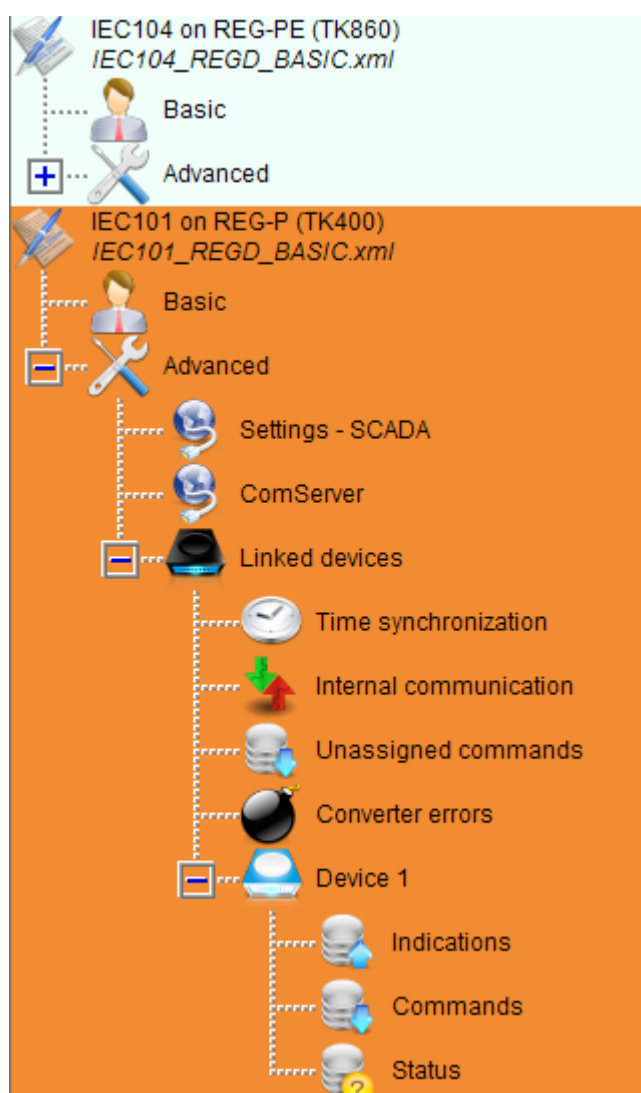

Figure 6: Settings tree

Each setting can be drilled down to sets of editable pages. Clicking the text in the tree structure selects the corresponding page in the right frame of WinConfig window.

9.2 Main menu buttons

- 0  **New** – create new settings based on a default template. User has to enter desired telecontrol board type, protocol, SCADA and device template. WinConfig creates new settings according to the selected options. If the selected SCADA and device template are not defined in WinConfig, a default template will be used instead. (Default settings are based on successful experience in the field and should only be changed if there is good reason to do so).
- 0  **Open** – open existing XML settings file or open then convert an existing INI settings file to the newer XML settings format. User has to enter/browse the required settings file and enter the target type of the telecontrol board in case of conversion from the older INI format.

- 0  **Remove** – remove selected settings from the tree in the WinConfig window. Selected settings are marked with an orange background. To select settings click the root node of the settings in the tree (e.g. DNP3 on REG-P (TK400))
- 0  **Save** – save the selected settings to the XML file on local disk.
- 0  **Compare** – comparison of settings in XML files with results stored in Microsoft Excel XLS file.
- 0  **Export** – export of selected settings to a Microsoft Excel XLS file.
- 0  **Transfer to PC** – transfer settings from a connected telecontrol board to WinConfig as described above.
- 0  **Transfer from PC** – transfer selected settings from WinConfig to the connected tele-control board as described above.

Figure 7: Main menu buttons

9.2.1 New settings

To create new settings from an existing template, please click *new* button. Select board type, protocol, SCADA template and devices template from combo boxes shown below then click the *Add* button. These newly created settings will appear in the settings tree.

The setting templates are divided into two editions in the case of IEC 61850 protocol. The edition of template can be chosen in the *Template edition* listbox. This listbox is disabled in the case of other protocols.

Add new settings

Add new settings from template

Board type:	REG-PED
Protocol:	DNP3
Template edition:	
SCADA template:	Basic
Attached Eberle devices:	1x REG-D(A)

Figure 8: Add new settings

Predefined templates

Valid workable combinations of board type / protocol / SCADA_template / Devices template are pre-defined in WinConfig. However, the default template files, which can be created, exist only for valid combinations already used and known.

If a template for a given combination is not available, a warning message will appear onto the screen:

Template file isn't implemented for chosen combination protocol/SCADA/Eberle devices! Default template will be used!

If the Continue button is pressed apart from invalid combinations, a default template will be used to create the new set of settings. Default templates typically contain basic configurations without pre-defined data points or commands.

9.2.2 Open, conversion from INI, import from Excel

Open Settings from file (XML settings)

In Order to open an existing XML settings file, convert an existing INI file or import a WinConfig-exported Excel file, please click the Open button. To open existing settings please browse the settings file by using the Browse button and then click the Open button in the Open settings from file Group-box

Convert settings from GenReg "*.ini" file

To convert settings from GenReg INI format, browse the file by using the Browse button, select required telecontrol board type from combo box and click the Convert button in the Convert settings from GenReg “*.ini” file frame. WinConfig will automatically detect the protocol described in the INI file and converts the settings to a suitable format for the required board type.

Import settings from WinConfig-exported Excel file

To import settings from WinConfig-exported Excel file, browse the file by using the Browse button and click Import button in the Import settings, from WinConfig-exported Excel file frame.

Open settings

Open settings from file

XML file name:

Open settings from application TAR file:

Convert settings from GenReg '*.ini' file:

Figure 9: Open settings

9.2.3 Remove, Save

- ➡ Click the Remove button to remove the selected settings from the settings tree.
- ➡ Click the Save button to save selected settings to a WinConfig XML settings file. Select folder and type the settings file name in the dialog box.

9.3 Compare settings function

Two compare modes can be found on the WinConfig Compare settings page. Select the desired mode in the Compare mode frame.

Compare selected settings with settings file

- ➡ To compare a pair of settings browse two xml setting files to compare, and then click the Compare button.

Compare two settings files

- ➡ To compare a currently selected settings with an xml setting file browse this file and click the *Compare* button.

Results of the comparisons are available in a Microsoft Excel xls file that is created from this comparison. Individual sets of settings are arranged in individual sheets in Excel workbook. Differences can be seen colored in the Excel sheets. Black fonts are used for matching pairs of settings, magenta fonts for different pairs and red fonts for missing settings.

Compare settings

Compare selected settings with settings file: ☐

Compare two settings file: ☒

First settings file

Second settings file

Operation

Progress:

Status:

Activity:

Figure 10: Compare settings

The third compare mode implemented in WinConfig is comparison of the selected settings with settings contained in the connected telecontrol board. This function is available in the Transfer settings to PC page as Compare to selected settings button. It is necessary to detect the board first in the case of remote mode. The rules of comparison are same as described above. This functionality cannot be used with TK509 telecontrol boards where Transfer settings to PC functionality are not available.

9.4 Rules for export/import using Microsoft Excel

9.4.1 Export to Excel

Ways of export:

- 0 Commands only of selected device from *Commands* page
- 0 Indications only of selected device from *Indications* page
- 0 Entire selected settings using *Export* icon in the main menu.

Data is exported into the new file winconfig-exportxx.xls placed in the system temp folder.

Individual parts of exported data are placed in individual sheets of Excel workbook, i.e. commands of each device and indications of each device are placed in corresponding sheets, e.g. sheet of indications of device A: is named *x. device A indications* and commands sheet is named *x. device A commands* (where x is the device order number). The character “:” in device name is skipped as Excel doesn’t allow usage of this character in the sheet name.

Data is arranged in lines. First line represents heading with settings names according to the corresponding XML template.

The exported sheets also contain plain text describing setting names. This information can be found in the second row of the table-based sheets and in second columns of the other sheets.

9.4.2 Import from Excel

Ways of import:

- 0 Commands from selected sheet to *Commands* page of selected device.
- 0 Indications from selected sheet to *Indications* page of selected device.

Import is performed from the Excel file with valid .xls extension. The file has to contain corresponding sheet with appropriate name and heading line with names of settings according to the corresponding XML template (see Export). Import function uses topical settings as target and replaces existing data in the target settings.

Import settings

Device	Import	Identifier of the device
1	<input type="radio"/>	A:
2	<input type="radio"/>	A:
3	<input checked="" type="radio"/>	A:
4	<input type="radio"/>	E1:
5	<input type="radio"/>	E2:

Figure 11: Import settings

We take care of it.

9.5 Migration of settings

WinConfig can migrate settings between different versions of telecontrol boards. The migration can be done in several ways:

- 0 Convert GenReg INI file with REG-P board type selected in the *Open settings* page (other than the telecontrol board for which INI file was originally created, e.g. INI file created for TK517 and IEC101 protocol can be open as IEC101 for TK400 telecontrol board).
- 0 Using Migrate button on Basic settings page. Available migrations are stated in the table below.

First step of migration and INI file conversion implemented in WinConfig is to check for completion and correctness of settings data. This has to be done due to some hardware differences that exist between some REG-P boards.

The *Missing/incorrect values* page provides user interaction possibility during the check process and default values are suggested for changing and confirmation.

Missing/incorrect values

Setting name: old value new value

IEC101

Reject commands with unknown address: not found ☒

Use originator (0): not found ☐

Time synchronization settings

Synchronize devices by REG-P: not found ☒

Synchronize all devices connected to ELAN: not found ☒

Figure 12: Missing/incorrect values

9.5.1 Available migrations

The migrations available in WinConfig v13.3.3. can be seen in the following table.

Table 6: Available migrations

Board	Target board	Protocols
TK400	TK28-4	DNP3 IEC101 IEC103
TK860	TK28-4	DNP3 IEC101 IEC103 IEC104 MODBUS SPABUS
	TK28-6	IEC101 IEC103 SPABUS
TK885	TK28-6	DNP3 IEC101 IEC103 IEC104 MODBUS SPABUS
	TK102	IEC101 IEC103 SPABUS

NOTICE:

In the case of IEC103 protocol it is desirable to check if data points type TI3 or TI6 are present in data points table. These types might require manual adjustment according to the IEC103 standard:

7.3.1.3 TYPE IDENTIFICATION 3: Measurands I

7.3.1.8 TYPE IDENTIFICATION 9: Mesures II

9.6 Checking of entered values

WinConfig pages containing tables (values are organized in tabular format, e.g. indications, commands) also contain online internal checking of individual cells. The check runs when the user leaves cell. Entered values are checked on valid limits. If limits are broken, the last or default value is automatically entered and cell is marked by red color. Correctly changed values are not marked. User cannot leave the page without confirmation or resetting of the changed values.

There is also additional integrity test of values present within the confirmation procedure. This test checks three basic rules:

- 0 Test of non-zero values of object addresses,
- 0 Existence of non-empty command strings in command tables,
- 0 Test of uniqueness of object address, which is performed entirely for all addressable objects in the settings, i.e. comparison of each address with other addresses. Uniqueness of devices text IDs is not tested. There are some exceptions from the rule e.g. in IEC103/TK8xx where TK3 type data points are tested on uniqueness together with measurement value type.

10. IEC104 settings

IEC 104 settings are available for TK860, TK885D, TK28x and TK102 telecontrol boards. Chapter IEC104 settings describes only settings not described above.

10.1 Basic

The *basic settings* tree branch contains table of 20 available IEC104 channels. Each IEC104 channel can be operated in client or server modes, the channel mode assumes corresponding remote side with corresponding remote IP addresses and remote ASDUs, i.e. IEC104 remote client for server mode and IEC104 server for client mode.

Basic

Settings description: IEC104_REGD_BASIC

IEC104 Channels

	Enabled	Remote IP Address	Remote ASDU Address	Client/Server Mode
1	<input checked="" type="checkbox"/>	192.168.1.92	1	top_server ▼
2	<input checked="" type="checkbox"/>	192.168.1.64	1	top_server ▼
3	<input checked="" type="checkbox"/>	192.168.1.43	1	top_server ▼
4	<input type="checkbox"/>	0.0.0.0	1	top_server ▼

Table 8: IEC104 settings - SCADA

Setting	Format	Range	Default	Description
Port	-	1 to 65535	2404	TCP port for IEC104 connection
Enabled	-	checkbox	unchecked	Option to enable/disable the corresponding IEC104 channel
Remote IP address	-	4x 0 to 255	192.168.1.68 192.168.1.64 192.168.1.43	IP addresses of remote station authorized for connection with telecontrol board
Remote ASDU address	-	0 to 65534	1	ASDU address of remote station authorized for connection with telecontrol board
ASDU address (ASDU2, ASDU1)	-	1 to 65534 or 0 to 255	62166	ASDU address
Errors data type	-	selection of values in combo box	TI30	IEC data type of errors
IEC address of error multipoint	-	0 to 16777215 or 3x 0 to 255	0/0/162	IEC address (IOA) of multipoint for errors
Reject commands with unknown address	-	option box	Not selected	Reject commands with unknown address (otherwise ignore)
Port	-	1 to 65535	2404	TCP Port
Max. telegram length	-	1 to 249	240	Maximum telegram length
k-Value	-	1 to 32767	12	Max. No. of invalidated APDUs
w-Value	-	1 to 32767	8	Acknowledge latest after this number of APDUs, $w \leq 2/3k$
t0-Timeout	s	1 to 255	30	Timeout for connection establishment
t1-Timeout	s	1 to 255	15	Timeout for send or test APDUs
t2-Timeout	s	1 to 255	10	Timeout for acknowledgement in the case of no messages $t2 < t1$
t3-Timeout	s	1 to 255	20	Timeout for sending test frames in case of idle state
Disable own GI-request	-	option box	Not selected	Enabling/disabling of initial GI sent from converter in TCP client mode. Option is valid for all IEC104 channels.

Setting	Format	Range	Default	Description
Short delay timeout 0-1	S	0 to 60	0	Short delay timeout for delayed indications and 0-1 change direction
Long delay timeout 0-1	S	0 to 60	0	Long delay timeout for delayed indications and 0-1 change direction
Short delay timeout 1-0	S	0 to 60	0	Short delay timeout for delayed indications and 1-0 change direction
Long delay timeout 1-0	S	0 to 60	0	Long delay timeout for delayed indications and 1-0 change direction
Timeout for analogue cyclic sending	s	0 to 650	0	Timeout for analogue (measurements) cyclic sending (0 = disable)
Max. command time difference	S	0 to 60	0	Maximal difference between command time and regulator time. The command is refused if the time difference is bigger.
Accept both commands with/without timestamp		checkbox	checked	Compatibility reasons when TIs with/without timestamp are separated. If checked, IEC104 accepts both variants.
Timezone offset (SCADA/RegSys difference)	Min	-1440 to 1440	0	Definition of timezone offset. This parameter is used for calculation of time difference of commands.

10.2.2 ComServer settings

IEC104 advanced settings tree branch contains ComServer specific settings.

COM-Server

Row count: 1

<input type="checkbox"/>	Activate	Connection type	TCP port	Inactivity timeout [s]	Serial port	Baud rate	Parity	XON/XOFF	RTS/CTS
<input type="checkbox"/>	Yes	Socket	5004	600	COM3	115200	None	No	Yes

To change serial port interface go to "Serial ports assignment" page.

Serial ports assignment

Figure 15: IEC104 ComServer settings

Table 9: IEC104 ComServer settings

Setting	Format	Range	Default	Description
Activate	-	Yes/No	No	Option to disable the channel
Connection type	-	Selection of values in combo box	RAW	State of channel. (SOCKET, Serial Direct, Telnet, Shared with IEC, OFF)
IP address	-	4x 0 to 255		IP address
TCP port	-	0 to 65535	3003	TCP port
Inactivity timeout	S		180	Timeout after which the serial device is closed if data transfer does not occur. By default is 0. It means that serial device is closed only by closing TCP-Port.
Serial port	-	Selection of values in combo box	COM2	Selection of serial port
Baud rate	Bd	Selection of values in combo box	115200	Baud rate
Parity	-	Selection of values in combo box	Even	Parity
Stop bits	-	Selection of values in combo box	1	Stop bits
Data bits	-	Selection of values in combo box	8	Data bits
XON/XOFF	-	Selection of values in combo box	No	Option to select XON/XOFF handshaking
RTS/CTS	-	Selection of values in combo box	No	Option to select RTS/CTS handshaking
RTS/CTS inverted	-	Selection of values in combo box	No	Option to select inversion of RTS, CTS signals
Rxd/TxD inverted	-	Selection of values in combo box	No	Option to select inversion of RxD, TxD signals
Interface type	-	Selection of values in combo box	RS232	Option to select type of interface
Max. message length	-	0 to 65535	0	Max. message length
Tx blocking time	ms	0 to 65535	0	Tx blocking time

Setting	Format	Range	Default	Description
NTP primary server IP address	IPV4	4x 0 to 255	0.0.0.0	NTP primary server IP address
NTP secondary server IP address	IPV4	4x 0 to 255	0.0.0.0	NTP secondary server IP address
PTP specific: VLAN ID			0	VLAN ID
PTP specific: Domain Number		0 to 255	0	Domain Number
PTP specific: PDelay-Request Minimum Interval		Selection of values from listbox	0	PDelay-Request Minimum Interval, 0 to 5
PTP specific: Delay-Request Minimum Interval		Selection of values from listbox	0	Delay-Request Minimum Interval, 0 to 5
PTP specific: Delay measurement		Selection of values from listbox	Auto	Delay measurement mechanism

Setting	Format	Range	Default	Description
mechanism				
PTP specific: Announce interval		Selection of values from listbox	1	Announce interval, 0 to 3. All PTP nodes in network should have the same value
PTP specific: Announce receipt timeout		2 to 10	3	Announce receipt timeout, all PTP nodes in network should have the same value
PTP specific: Sync. interval		Selection of values from listbox	none	Synchronization interval, 0 to 2

10.3.3 Internal Communication

Communication settings tree branch contains communication settings of devices for TK8xx board types and IEC104 protocol conversion.

Internal communication

Baud rate of device serial port [Bd]:

ON time of serial LEDs [10ms]:

Timeout for reception of first char [10ms]:

Inter character timeout [10ms]:

Number of repeats for SYNC cycle:

Number of poll repeats:

Discard cmd. buffer after TI30/TI31 error: ☐

Time to wait after answer rec. [ms]:

Time to stop device interrogation [s]:

Round time down: ☒

Round time up: ☐

RBAC timeout:

Figure 20: Internal communication settings

Table 13: IEC104 Device communication settings

Setting	Format	Range	Default	Description
Baud rate of device serial	Bd	1200-115200	115200	Baud rate of device serial port
ON time of serial LEDs	10 ms	1 to 100	2	ON time of serial LEDs
Timeout for reception of first char	10 ms	1 to 255	50	Timeout for reception of first character
Inter character timeout	10 ms	1 to 255	20	Timeout between two characters in telegram
Number of repeats for SYNC cycle	-	1 to 255	10	Number of repeats for SYNC cycle
Number of command repeats	-	1 to 255	3	Number of command (poll) repeats
TX blocking	ms	0 to 255	0	Time to wait when answer was received
Time to stop reg. interrogation	s	0 to 650	0	Time to stop regulator interrogation after IEC communication break
Round time down / up	-	option box	round down	Rounding time selection
RBAC timeout	s	30 to 600	300	RBAC timeout for RegSys firmware supporting user roles and rights and telecontrol boards TK8x and TK102

10.3.4 IEC104 Commands

The IEC104 commands table contains commands and also data points transmitted in the direction toward to the REG-PE(D) board.

Figure 21: IEC104 commands

Table 14: IEC104 commands

Setting	Format	Range	Default	Description
Common address of ASDU	-	0 to 65534	1	ASDU address of remote station authorized for connection with telecontrol board
Information object address (IOA)	-	0 to 16777215 or 3x 0 to 255	0	IOA of the corresponding data point
Control code		Selection of values in listbox	Ti45/Ti58	Type of information object
Command string	text	50 characters		Command string
Scale exponent	-	Selection of values in listbox	1/0	Addition command parameter according to the available list
100% value	-	0 to 65535	0	100% value, available for Ti48 only
Description	text	50 characters		User description
Range min.	-	-32768 to 32767	0	Command value range – minimal value
Range max.	-	-32768 to 32767	0	Command value range – maximal value

10.3.4.1 Command parameters not available in GUI

Some command parameters available cannot be set via GUI. User has to edit such parameters directly in the XML template using suitable text editor. A care has to be taken in such case, as text editor cannot check correctness of such input.

The parameters>

```
<protocol type="IEC104">
  <params t0="30" k="12" error_datatype="30" us_asdu_address="1" max_tlg_len="240" t1="15" port="2404" t3="20"
    error_iec_addr="0/0/162" t2="10" w="8" reject_unknown_addr="1" cmd_actterm_delay="2000" initial_GI_off="0"
    delay_short_up_tmout="5" delay_long_up_tmout="7" delay_short_down_tmout="9" delay_long_down_tmout="11"
    use_locrem="1" cmd_time_diff="60" offset_tapdown="5" bit_pos_tapdown="3" offset_tapup="5" bit_pos_tapup="2"
    cmd_accept_both_tk="1" timezone_offset="0" lauf Lampe_offset="5" lauf Lampe_bit="1"/>
```

are placed in the *params* section of the IEC104 protocol.

Another parameters are placed directly in the command definition:

```
<cmd asdu="1" descr="Hand/Auto" ioa="0/32/8" control_code="46" command_str="RegAUTO=" scale_exp="0" value100="0"
  offset="3" bit_pos="5" min_val="0" max_val="0" act_term_delay="2000" offset_2="0" bit_pos_2="0" value_2="0"
  offset_watch="0" reg_type_watch="0" bit_watch="0" tap_pos_timeout_sec="0"/>
```

The modifications are focused to the modification of command behaviour.

Parameters and meaning:

- 0 **use_locrem** – the software will take into account the value of local/remote indication when accepting/refusing command.
- 0 **cmd_time_diff [s]** – max. time difference between command time and regulator time. This parameter is processed by GUI, see Settings - SCADA.
- 0 **offset_tapdown, bit_pos_tapdown, offset_tapup, bit_pos_tapup** – a special parameters for the tap change command. The parameters allow to use a different indication for the tap change in direction up and down. The appropriate indication has to go UP before expiration of the timeout defined by **actterm_delay**. Otherwise the command is refused. These indications act as additional condition for the **lauf Lampe** parameter.
- 0 **lauf Lampe_offset, lauf Lampe_bit** - the running tap is indicated by a special indication and the entire process has to finish before the expiration of **tap_pos_timeout_sec** timeout. Otherwise, the command is refused.
- 0 **cmd_accept_both_tk** – option to accept both commands with/without timestamp. This option is processed by WinConfig GUI where it is represented by checkbox, see Settings - SCADA.
- 0 **delay short_up_tmout, delay long_up_tmout, delay short_down_tmout, delay long_down_tmout [s]** – parameters dedicated to the delay of indications. These pa-

parameters are processed by WinConfig GUI and are not related to commands (see Settings - SCADA).

- 0 ***cmd_acctterm_delay* [ms]** – definition of delay of command activation termination. This is valid for all commands except of the TAP command.
- 0 ***min_val, max_val*** – these parameters are dedicated for check of valid range of the bound data point. The command is refused if the data point is out of range. The command is also refused if the command value is the same as the data point value. These parameters are functional only in the case when the *max_val* is bigger than *min_val*.
- 0 ***acctterm_delay* [ms]** – definition of additional delay of command activation termination. This is valid for individual commands. Another function of *acctterm_delay* is to act as additional timeout in the case of TAP command. The additional timeout defines the time, when the indication of Tap running up or down has to go ON. Otherwise the command is finished by negative activation termination.
- 0 ***tap_pos_timeout_sec* [s]** – definition of special delay for TAP command. Non-zero value also defines valid TAP command. The TAP command doesn't use *acctterm_delay* and *cmd_acctterm_delay*.
- 0 ***offset, bit_pos*** – meaning of these parameters in command is definition of data point that is bound to the command and the value of this data point is checked first before the command execution. If the value is the same as the one contained in command, the command is refused.
- 0 ***value_2, offset_2, bit_pos_2*** – definition of 2nd data point that is bound to the command and the value of this data point is checked first before the command execution. The expected value is defined by *value_2*.
- 0 ***offset_watch, reg_type_watch*** – definition of additional setpoint (analog value) that is supposed to change during the command execution. The negative activation termination is issued, if the setpoint didn't change during the command execution. Possible values of *reg_type_watch* are "byte", "word", "dword", "float", "sbyte" according to the type of analog value in RPS structure.

Another meaning of these parameters is watching the single bit indication. In such case the *reg_type_watch* value is "bit" and another parameter *bit_watch* is used for position of the bit within the byte defined by *offset_watch* parameter. The negative activation termination is issued, if the bit being watched didn't change during the command execution. The positive activation termination is issued immediately when the change is detected.

Meaning of zero values is *NOT USED*.

Figure 22: IEC104 indications

Table 15: IEC104 indications

Setting	Format	Range	Default	Description
Description	text	50 chars	empty	Description
IEC object type	-	selection of values in list box	TI1	Indication type in IEC communication
RegSys type	-	selection of values in list box	Bit	Indication type in device communication
Information object address (IOA) (IOA (hi/mi/lo))	-	0 to 16777215 or 3x 0 to 255	0	IEC address (IOA) of indication
Abs. deviation	float		0	Absolute deviation value
Scale	float		0	Scale value
Max. value	-	0 to 65535	32767	Max. value
RPS offset	-	0 to 255	0	RPS offset
RPS bit	-	selection of values in list box	0	RPS bit
IV RPS offset	-	0 to 255	0	RPS offset of additional indication bearing the invalidity information
IV RPS bit	-	selection of values in list box	0	RPS bit of additional indication bearing the invalidity information
IV RPS bit inverted	-	selection of values in list box	No	Indication flag for inversion of invalidity information
Cyclic	-	selection of	No	Flag to indicate cyclic data point

Setting	Format	Range	Default	Description
		values in list box		transmission. The period is defined in the <i>Internal communication</i> section.
Delayed	-	selection of values in list box	No	Flag to delay transmission of the data point change. The delay defined in <i>Settings - SCADA</i> page will be applied.
Range min. and Range max.	float	-	0	Definition of valid range of the data point. The data point will be marked as OVERFLOW if out of the range. 0 means that this property is switched off.
Use in GI	-	selection of values in list box	Yes	Usage of indication in General Interrogation
Gr. 0	-	selection of values in list box	Yes	Group 0 in general interrogation
Gr. 1	-	selection of values in list box	No	Group 1 in general interrogation
Gr. 2	-	selection of values in list box	No	Group 2 in general interrogation
Gr. 3	-	selection of values in list box	No	Group 3 in general interrogation
Gr. 4	-	selection of values in list box	No	Group 4 in general interrogation

The available types of information objects are stated in the following list:

- 0 TI30
 - Single-point information with time tag
- 0 TI31
 - Double-point information with time tag
- 0 TI9/TI34
 - Measured value, normalized value/ Measured value, normalized value with time tag
- 0 TI13/TI36
 - Measured value, short floating point value/ Measured value, short floating point value with time tag
- 0 TI45/TI58
 - Single command/ Single command with time tag
- 0 TI46/TI59
 - Double command/ Double command with time tag
- 0 TI47/TI60
 - Regulating step command/ Regulating step command with time tag
- 0 TI48/TI61
 - Set point command, normalized value/ Set point command, normalized value with time tag
- 0 TI49/TI62
 - Set point command, scaled value/ Set point command, scaled value with time tag
- 0 TI50/TI63
 - Set point command, short floating point value/ Set point command, short floating point value with time tag

Scale	-	selection of values in combo box	1	Scale, valid for analog data type
Command string	text	50 characters	empty	Command string
Description	text	50 characters	empty	User description

11.3.4 Information about installed DNP3 version

The DNP3 firmware contains a special function to facilitate the access to the information about installed DNP3 firmware version. This information can be seen on the Regsys screen for a short period of time during the telecontrol board start.

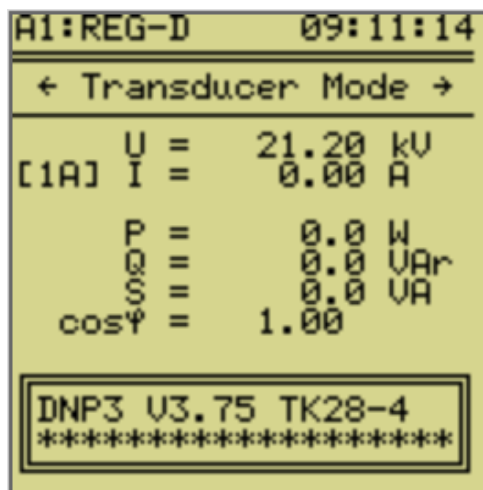

Figure 30: Information about the DNP3 firmware version

11.4 MODBUS Collector for DNP3/TKxx

DNP3 comes additionally with Modbus-Collector-Functionality, which provides a MODBUS-RTU Master to retrieve information from Modbus-slaves to be processed in a-eberle-device.

The MODBUS Master can receive pre-defined analogue values from up to 32 MODBUS-RTU server and to be processed in a-eberle devices. Usage of MODBUS-RTU using is optional.

Basic settings tree branch form contains common settings of MODBUS-RTU.

Extended settings shall be done by a-eberle staff.

Figure 34: CSO settings REG-P

Table 26: CSO settings REG-P

Setting	Format	Range	Default	Description
Settings description	text	50 characters	Filename of open settings	Short user description of settings file or name of settings file.
Local (REG-P) IP address	-	4x 0 to 255	192.168.56.90	Local (REG-P) IP address
Gateway IP address	-	4x 0 to 255	192.168.1.43	IP address of default gateway
Subnet mask	-	4x 0 to 255	255.255.0.0	Subnet mask
Accept any valid client IP	-	checkbox	checked	Accept any valid client IP
Refuse second connection	-	checkbox	checked	Refuse second connection if other connection is already set. Otherwise the current connection is closed and the new one established.
Authorized central stations IP addresses	-	4x 0 to 255	0.0.0.0	IP address of authorized central stations, 6 available addresses
TCP port (data transfer)	-	1 to 65535	1023	TCP port for data transfer. Changing of this value is not recommended.
UDP port (remote parameterization)	-	1 to 65535	12000	UDP port for remote parameterization. Changing of this value is not recommended.
Baud rate of device serial	Bd	selection of values in combo box	115200	Baud rate of device serial communication. Device settings are accessible after clicking the Enable button. Experienced staff should do changing of device settings only.
Timeout of REG-P responses	10ms	1 to 255	200	Timeout of REG-P responses
Inter character timeout	ms	1 to 255	70	Timeout between two characters in device communication
Time to wait after REG-P response	ms	0 to 255	0	Timeout after message reception

13. CSO settings TK28-8

CSO parameters for TK28-8 board are similar to those for TK400 – see CSO settings REG-P. However, as the TK28-8 is linux-based board, there are also another functions available.

TK28-8 board can run also supervisory settings using Syslog with parameters defined e.g. in protocol *IEC103: Supervisory settings for boards type TK28-4, TK28-6, TK102*.

Also a time synchronization is defined using NTP server or PTP (Precision Time Protocol) as defined in protocol *DNP3: Time synchronization for boards type TK28-4, TK28-6 and TK102*.

Level	-	Selection of values in combo box	user	Option to select lever of supervisory messages (user, developer)
Verbose Output	-	checkbox	unchecked	Verbose Output
Trace via PARAM-Connector)	-	radio button	checked	Logging to PARAM-Connector
Trace via TCP-Port	-	radio button	unchecked	Logging to TCP port
TCP port	-	1 to 65535	55555	TCP port
Logging with Timestamp	-	checkbox	checked	Logging with Timestamp
Mirror port: Activate trace	-	checkbox	checked	Mirror port: Activate
TCP-port	-	1 to 65535	55444	TCP port

15. CSO Time synchronization

The *Time synchronization* tree branch is available for telecontrol boards type TK28-4, TK28-6 and TK102.

Time synchronization

NTP

NTP primary server IP address:

NTP secondary server IP address:

PTP synchronization specific

PTP clock activate: ☒

PTP synchronization specific

Domain Number:

PDelay-Request Minimum Interval: ▼

Delay-Request Minimum Interval: ▼

Delay measurement mechanism: ▼

Announce interval: ▼

Announce receipt timeout:

Sync interval: ▼

Figure 37: CSO time synchronization for boards TK28-4, TK28-6, TK102

Table 29: CSO Time synchronization for boards type TK28-4, TK28-6 and TK102

Setting	Format	Range	Default	Description
NTP primary server IP address	IPV4	4x 0 to 255	0.0.0.0	NTP primary server IP address
NTP secondary server IP address	IPV4	4x 0 to 255	0.0.0.0	NTP secondary server IP address
PTP specific: VLAN ID			0	VLAN ID
PTP specific: Domain Number		0 to 255	0	Domain Number
PTP specific: PDelay-Request Minimum Interval		Selection of values from listbox	0	PDelay-Request Minimum Interval, 0 to 5
PTP specific: Delay-Request Minimum Interval		Selection of values from listbox	0	Delay-Request Minimum Interval, 0 to 5

Setting	Format	Range	Default	Description
PTP specific: Delay measurement mechanism		Selection of values from listbox	Auto	Delay measurement mechanism
PTP specific: Announce interval		Selection of values from listbox	1	Announce interval, 0 to 3. All PTP nodes in network should have the same value
PTP specific: Announce receipt timeout		2 to 10	3	Announce receipt timeout, all PTP nodes in network should have the same value
PTP specific: Sync. interval		Selection of values from listbox	none	Synchronization interval, 0 to 2

The time synchronization in CSO synchronizes only the telecontrol board system due to correct functionality of LDAP services. The connected Regsys device is not time-synchronized.

16. Modbus settings

You are able to select of either two connection type “serial” or “TCP”.

16.1 Basic settings MODBUS RTU

Basic settings tree branch form contains common settings of MODBUS protocol – selection of available Baud rates, Slave address and identifier if device (devices). Basic settings also contain use definable description - name of the entire settings.

Basic

Settings description:

Line type: serial ▼

Baud rate of serial port MODBUS [Bd]: 19200 ▼

Slave Address/Unit ID:

RS485 activated: ☐

Device	Identifier of device
1	AA: <input style="width: 100%;" type="text"/>

Confirm
Reset

Figure 38: MODBUS RTU basic settings

Table 30: MODBUS basic settings

Setting	Format	Range	Default	Description
Settings de- scription	Text	50 characters	Filename of open settings	Short user description of settings file or name of set- tings file
Slave address	-	1-247	2	Address of slave
RS485 acti- vated	Bd	Checkbox	unchecked	If unchecked then RS232 or fiber optic mode is selected.
Identifier of device	text	AA: or A(1 to 9): to Z(1 to 4):	defaults defined in the Devices tree branch	Device identifier string as appears in the device proto- col

16.2 Basic settings MODBUS TCP

Basic settings tree branch form contains common settings of MODBUS TCP protocol – selection of Unit ID and identifier if device (devices). Basic settings also contain user definable description - name of the entire settings.

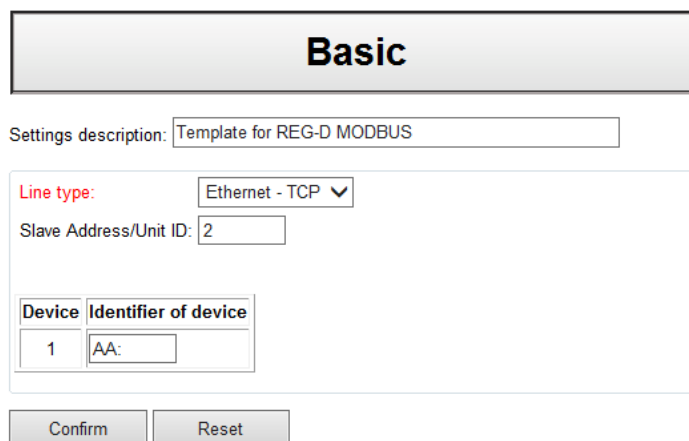

Figure 39: Modbus TCP basic settings

Table 31: MODBUS TCP basic settings

Setting	Format	Range	Default	Description
Settings de- scription	Text	50 characters	Filename of open settings	Short user description of settings file or name of set- tings file.
Unit Id	-	1-247	2	Slave Address (same as the Unit ID used in MODBUS TCP/IP).
Identifier of device	text	AA: or A(1 to 9): to Z(1 to 4):	defaults defined in the Devices tree branch	Device identifier string as appears in the device proto- col

The port number is default 502.

16.3 Advanced - Settings - SCADA

Advanced settings tree branch contains the complete range of MODBUS settings:

MODBUS

Interface settings

Serial port: COM1

Baud rate of serial port MODBUS [Bd]: 19200

Parity: EVEN

ON time of serial LEDs [ms]: 20

RS485 activated: ☐

RTS/CTS: ☐

XON/XOFF: ☐

Protocol settings

Slave address: 2

Response timeout [ms]: 5

Turnaround delay [ms]: 250

No reply: 0

Mode of watchdog LED: blinking

Confirm

Reset

Figure 40: MODBUS SCADA settings

Table 32: MODBUS advanced settings

Setting	Format	Range	Default	Description
Serial port	-	Selection of values in combo box	COM1	Selection of available COM ports for Modbus communication
Baud rate of serial [Bd]	Bd	Selection of values in combo box	19200	Baud rate of Modbus serial port
Parity	-	Selection of values in combo box	Even	Parity of Modbus serial port
ON time of serial LEDs	ms	0 to 65535	20	ON time of serial LEDs indicating activity on the Modbus serial interface
Slave address	-	1-247	2	Address of slave
RS 485 activated	-	checkbox	Not checked	Activation of RS485 interface
RTS/CTS	-	checkbox	Not checked	RTS/CTS handshaking
XON/XOFF	-	checkbox	Not checked	XON/XOFF handshaking
Response timeout	ms	2 to 100	5	SCADA response timeout
Turnaround delay	ms	0 to 65535	250	Turnaround delay
No reply	-	0 to 255	0	No reply
Mode of watchdog LED	-	Selection of values in combo box	blinking	Mode of watchdog LED (blinking/switched off)

16.4 Devices

Devices tree branch is the same as for IEC101 protocol. See chapter 11.2.

16.4.1 Time synchronization

Time synchronization tree branch is the same as for IEC101 protocol. See chapter 11.2.2.

16.4.2 Internal communication settings

Device communication settings contain the following options:

Internal communication

Baud rate of device serial port [Bd]:	115200 ▼
Parity:	EVEN ▼
ON time of serial LEDs [ms]:	10
Timeout for reception of first char [ms]:	150
Inter character timeout [ms]:	200
TX blocking [ms]:	250
Number of repeats for SYNC cycle:	3
Number of poll repeats:	1
Round time down:	<input type="radio"/>
Round time up:	<input checked="" type="radio"/>
Use UTC for time synchronization:	<input type="checkbox"/>
RBAC timeout:	300

Figure 41: Device internal communication settings

18. IEC61850

18.1 General Information

The firmware, according to IEC 61850-6, imports an SCL file with name space definitions. The contents of described attributes are used to generate a project specific MMS-context from SCL file. The project specific file with extension .ICD is located in settings with *.xml file.

WinConfig and SCL_Config engineering Tool represent for REG-PE / REG-PED all data attributes as product (IED) model.

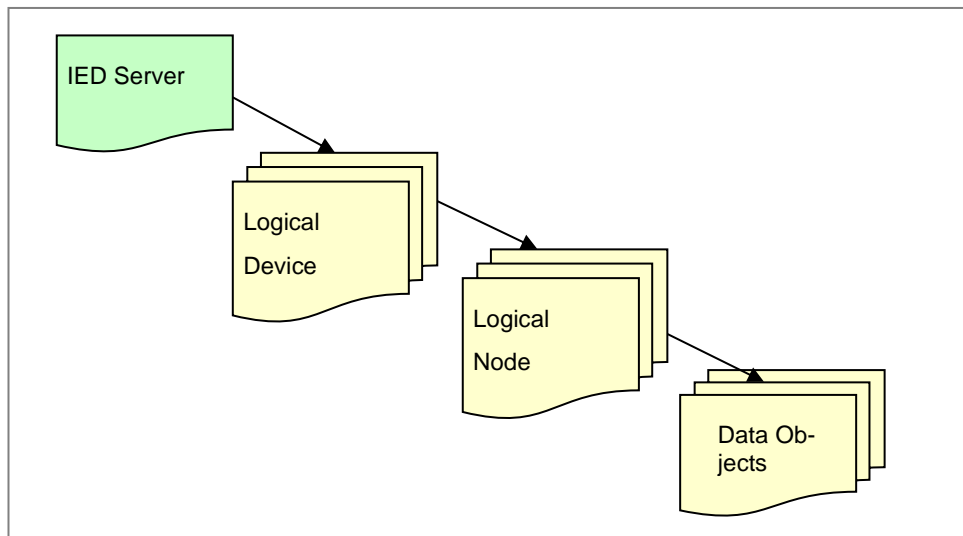

Figure 54: Product (IED) Model

- 0 IED - substation automation (SA) device performing SA functions by means of logical nodes (LNs). It allows access via the communication system and is the only access point to the data of the logical devices and logical nodes contained in the server.
- 0 LDevice - a logical device (LD), according to IEC 61850-7-2, that is contained in the server of IED.
- 0 LNode - a logical node (LN). The LN contains Data (DO), which other logical nodes request, and it may need DOs contained in other LNs to perform its function. The offered DOs (server capability) are described in ICD - file.
- 0 DO - the DATA contained in the LNs.

The tree view sub-entries of the server are directly resolved from the name space of the ICD file.

18.2 SCL_Config engineering Tool

This Tool lets you do the following:

- 0 creating new project of WinConfig settings with ICD-file,
- 0 creating new project of archive jffs2.tar with ICD-file from a template project or other archive,
- 0 creating new project of WinConfig settings from archive jffs2.tar,
- 0 viewing the ICD-file in a tree structure,
- 0 using this tool as project-independent basis to edit objects and nodes of ICD-file in a comfortable way for project specific use. I.e. a common base can be modified to fit your project depending settings,
- 0 viewing and editing the GOOSE publishers and subscribers.

IEC61850-engineering tool.

Figure 56: Execute SCL_Config engineering Tool

After adjustment and saving in SCL_Config engineering Tool, all changes have to be activated in WinConfig automatically.

The tree view subentries of the server are directly resolved from the name space of the ICD file. This defines that there may be different names for the logical devices and their subordinated Nodes and their subordinated attributes.

That's why only an example can be discussed in the description.

18.2.1 Displaying project configuration and properties of nodes

ICD-file is shown as the logical structure tree on page "Configuration". On the right panel of the page section "IED" parameters are shown, as well as options of the configuration logical object and options of the field sAddr, if exists in the chosen object DAI.

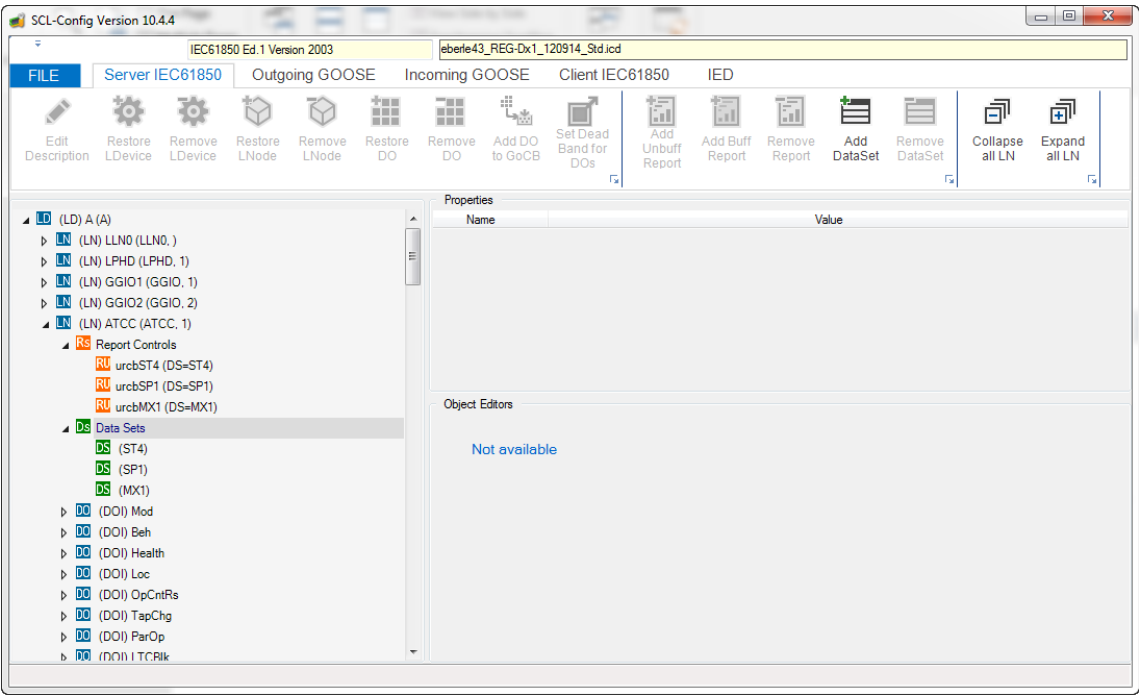

Figure 57: Displaying the project configuration

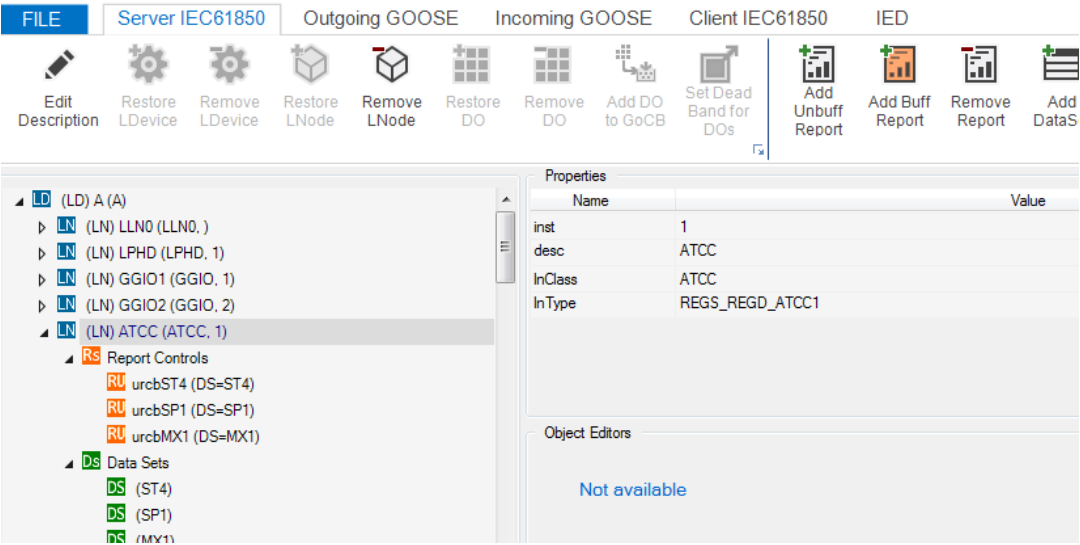

Figure 58: Displaying the properties of nodes

18.2.2 Adding, deleting and renaming devices

Configuration change is done on the page "Configuration". To change the content of the device and its name use hot-keys and popup menu panel "Device".

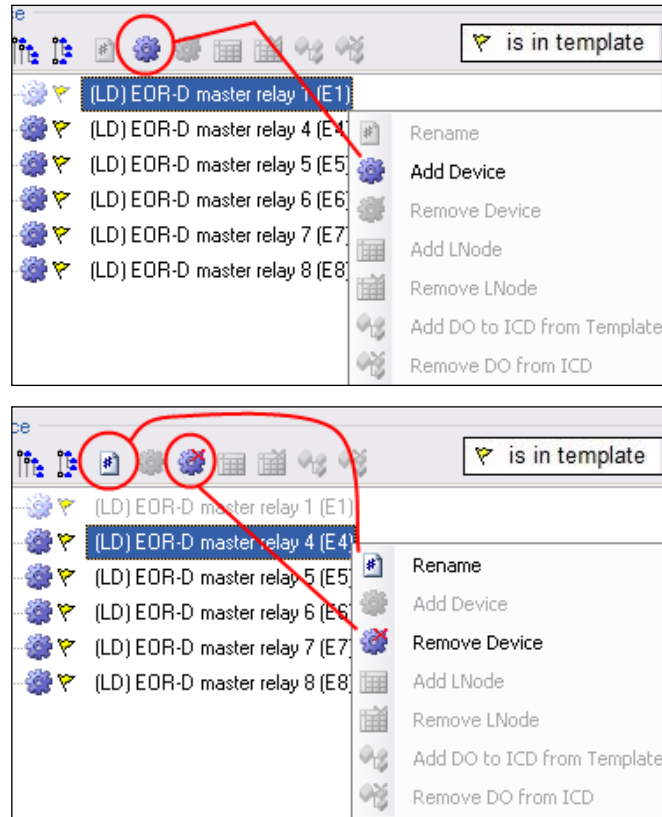

Figure 59: Adding and deleting devices

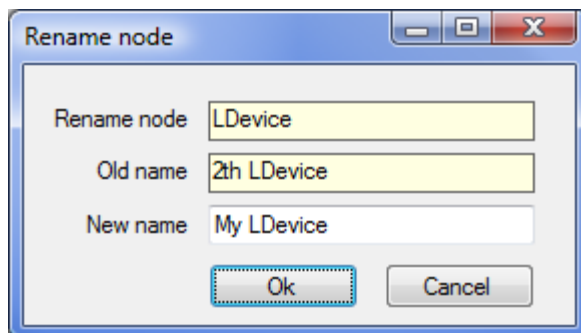

Figure 60: Renaming device

18.2.3 Adding, deleting and renaming logical nodes

To add new logical nodes of the necessary type, to rename or delete from the configuration use hot-keys and popup menu of the panel “Device”.

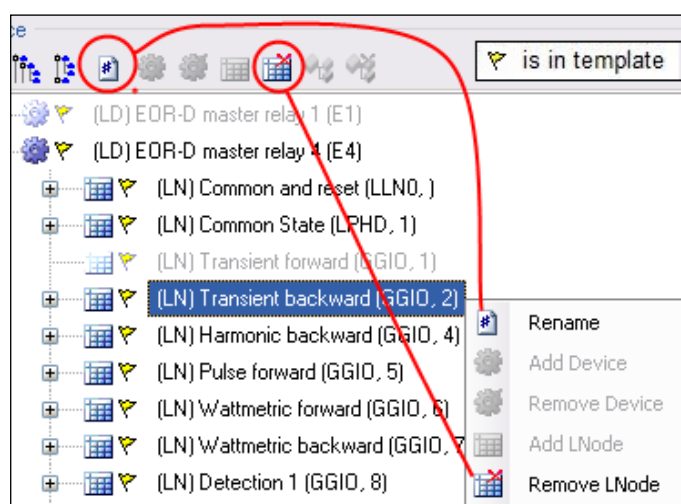

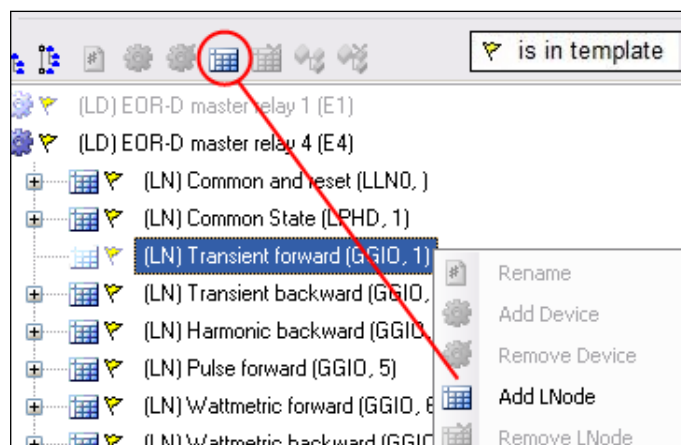

Figure 61: Adding, deleting and renaming logical nodes

18.2.4 Editing sAddr

18.2.4.1 ST/MX Data Object

Upon choosing DAI “stVal” on the right panel “sAddr Editing” parameters’ editor of sAddr field is available. To accept changes of the parameters press OK, to cancel the changes press Cancel.

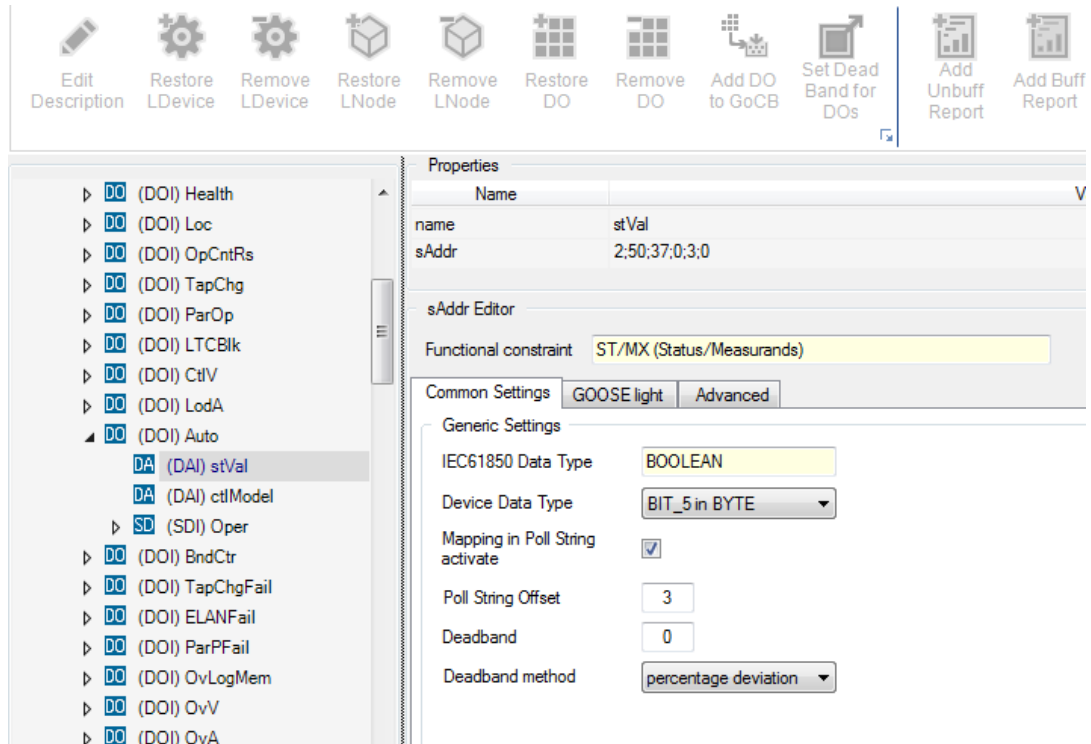

Figure 62: Editing sAddr

Such editors are accessible for the use:

18.2.4.2 REG-D(A) Logbook Acquisition Settings for Status DO

All important events are stored in the log together with the respective time and date. Up to 2000 events can be stored in total. The LOG memory is a FIFO rotating memory, i.e. if the memory is full, the oldest entry will be replaced with the newest event.

A data object status event can be monitored by acquisition events from REG-D logbook.

For example, data object "Auto" will be monitored by events from REG-D logbook. The figures below show the settings data object "Auto" that will be monitored by acquisition events AUTO from Logbook.

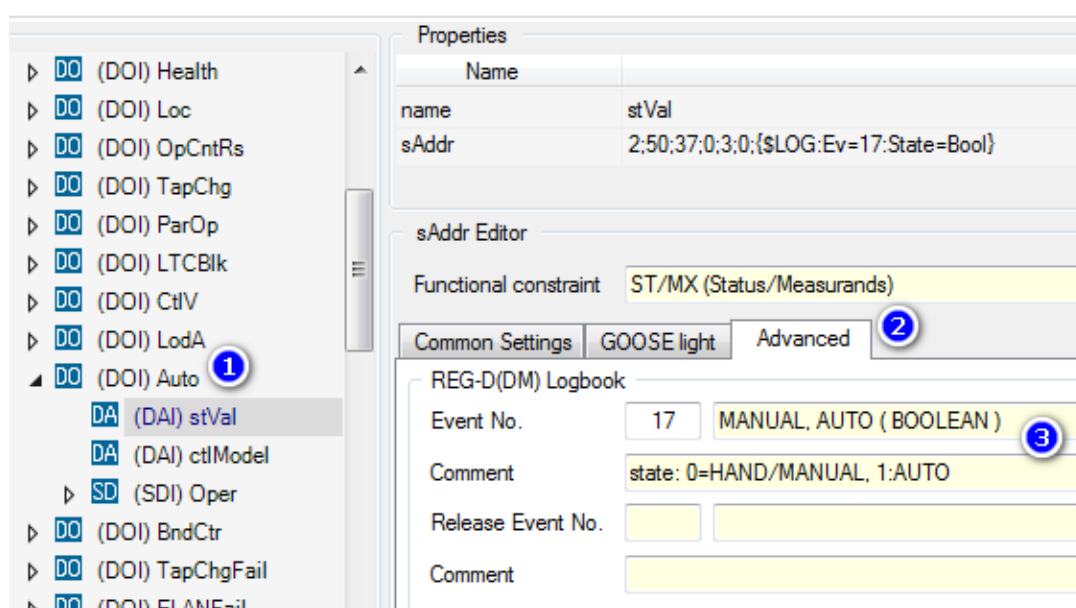

Figure 66: DO status is monitored by logbook events

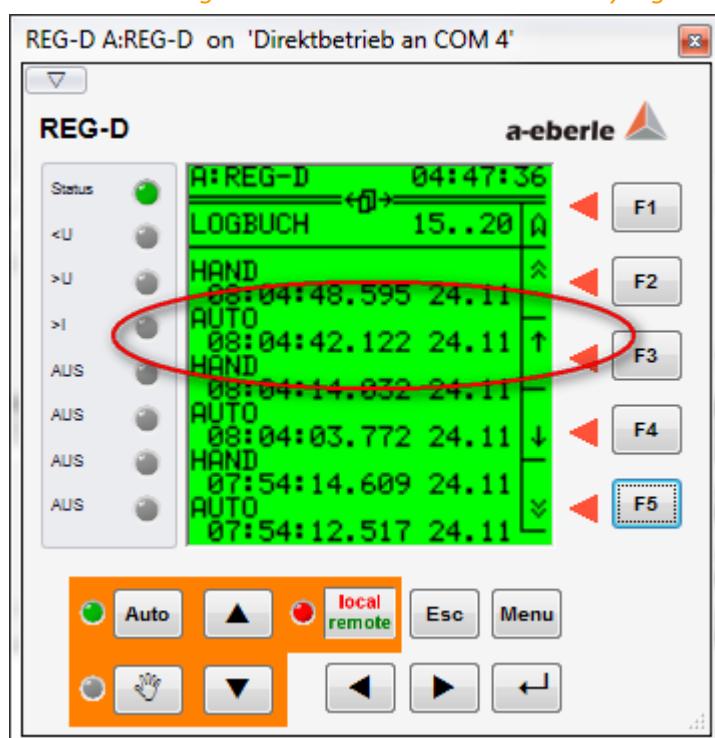

Figure 67: Event "Auto" in the Logbook

You can select monitored event from a list of Events or enter a number of event in the field "Event No." (Advanced Settings).

18.2.5 Removing Data Objects

Removing of DO is executed in two steps:

- 1) when a user executes the function "Remove DO" in application:
 - verifications of name
 - mandatory DO list for LPHD Logical Node - "PhyNam", "PhyHealth", "Proxy", for other - "Mod", "Beh", "Health", "NamPlt". A removing the DO is blocked.
 - if DO is system, confirmation of operation is required. A not system DO has a DA with name "dataNs"
 - ICD can have more than one of Logical Node same type, that means all these DO will be removing. List of LN will be shown and confirmation of operation is required
 - removing DOI from LNode
 - excluding empty Data Sets
 - excluding Reports without data set.
- 2) when a user closes project - removing unused DO's types from the section "DataTypeTemplates"

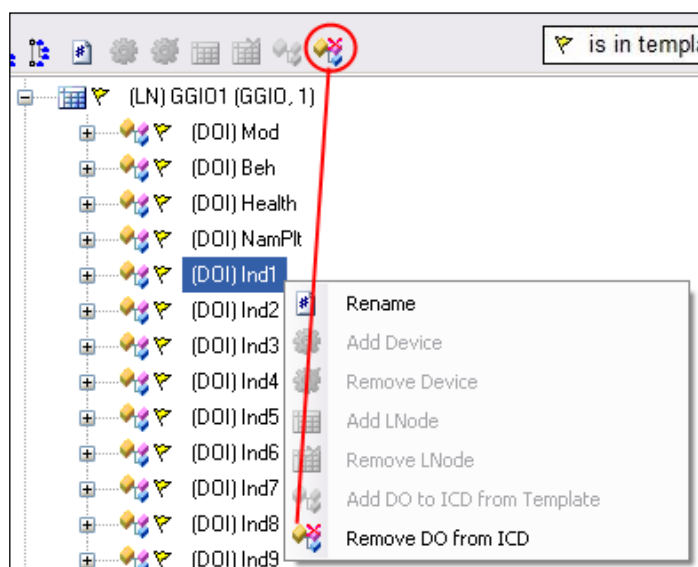

Figure 84: Removing Data Objects

18.2.6 Restore Data Objects from Template

Restoring of DO is executed when an user executes the function “Restore DO” in application. Based on a template (original ICD-file) is created:

- 0 in the section “DataTypeTemplates” - DO Type and DO for LNodeType, if they are not exists
- 0 DOI for all LNode of the LNodeType
- 0 DataSet and Report, if they are not exists

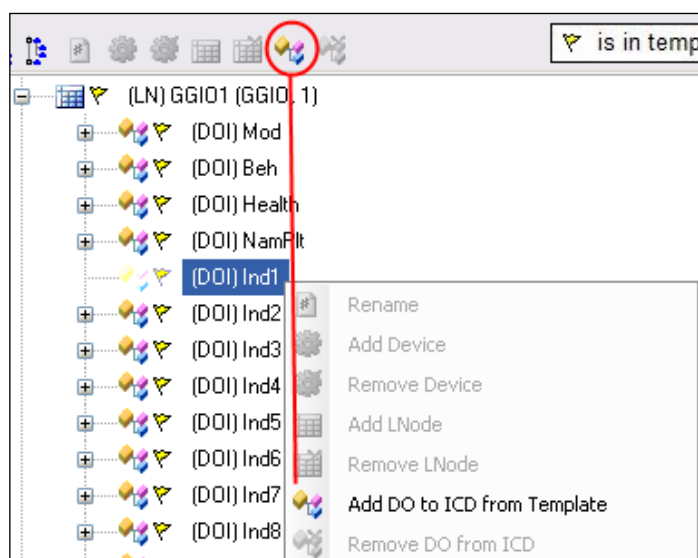

Figure 85: Restore Data Objects from template

18.2.7 Renaming Data Objects

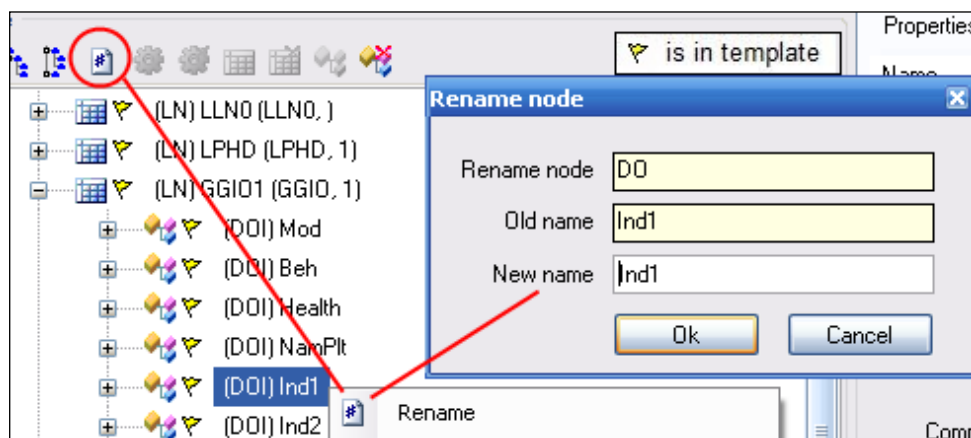

Figure 86: Renaming the Data Objects

Algorithm of renaming DO

1) verifications of old name

- Mandatory DO list for LPHD Logical Node - "PhyNam", "PhyHealth", "Proxy", for other - "Mod", "Beh", "Health", "NamPlt". A change the name is blocked.
- If DO is system, confirmation of operation is required. A not system DO has a DA with name "dataNs".
- ICD can have more than one of Logical Node same type, that means all these DO will be renamed.

List of LN will be shown and confirmation of operation is required

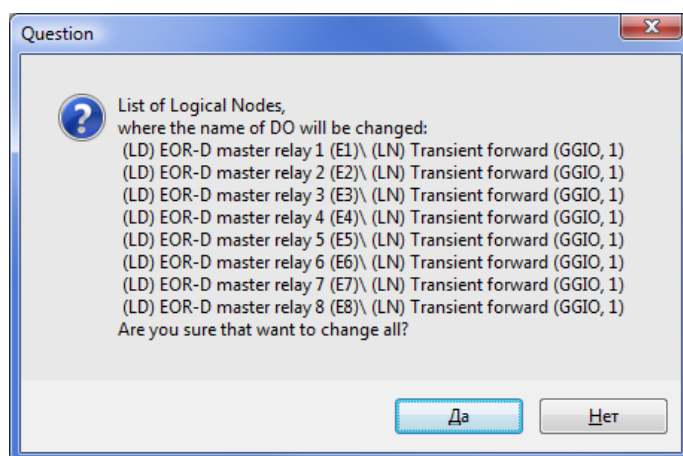

Figure 87: Confirmation to rename DO list

1) verifications of new name

- A change the name from mandatory DO list is blocked.
- If the new name exists, renaming is canceled

2) Rename DO in LNodeType from section "DataTypeTemplates"

3) Rename DOI in Logical Node

- 4) Rename FCDA in DataSets of Logical Node

18.2.8 Changing of DO Data Class

Changing of DO Data Class is accessible for changing “SPC” to “DPC” and vice versa. In this case DO Editor is displaying on editor panel.

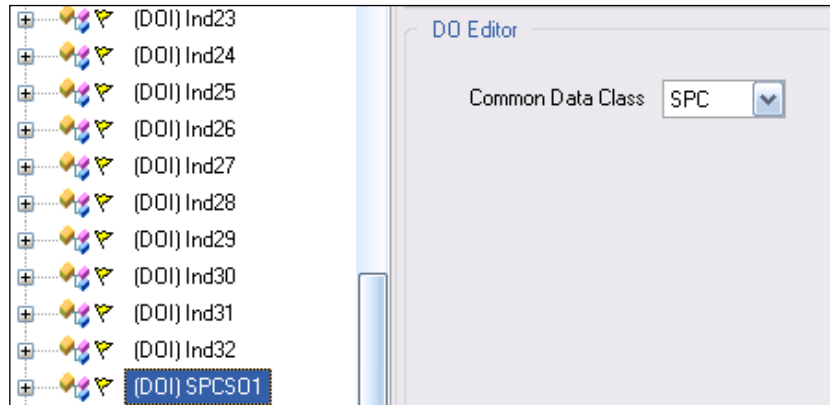

Figure 88: Changing of DO Data Class

Algorithm of changing of DO Data Class:

- 1) Changing of DO Data Class is accessible for changing “SPC” to “DPC” and vice versa
- 2) Search DOType in LNodeType from section “DataTypeTemplates” where:
 - “id” = new type (“SPC” or “DPC”)
 - DOType has not DA with name “SBOW”
 - If DOType has DA with name “dataNs”, it is preferring
- 3) Setting the new value of Type Id for DO
- 4) DO will to have new Data Class
- 5) If new DOType is not searched, then changing is canceled

18.2.9 Changing the control model for controllable data objects

For “Status only” Data Objects a control model does not change.

Changing of DO Data Class is accessible for four control models:

- Direct with normal security
- SBO with normal security
- SBO with enhanced security
- Direct with enhanced security

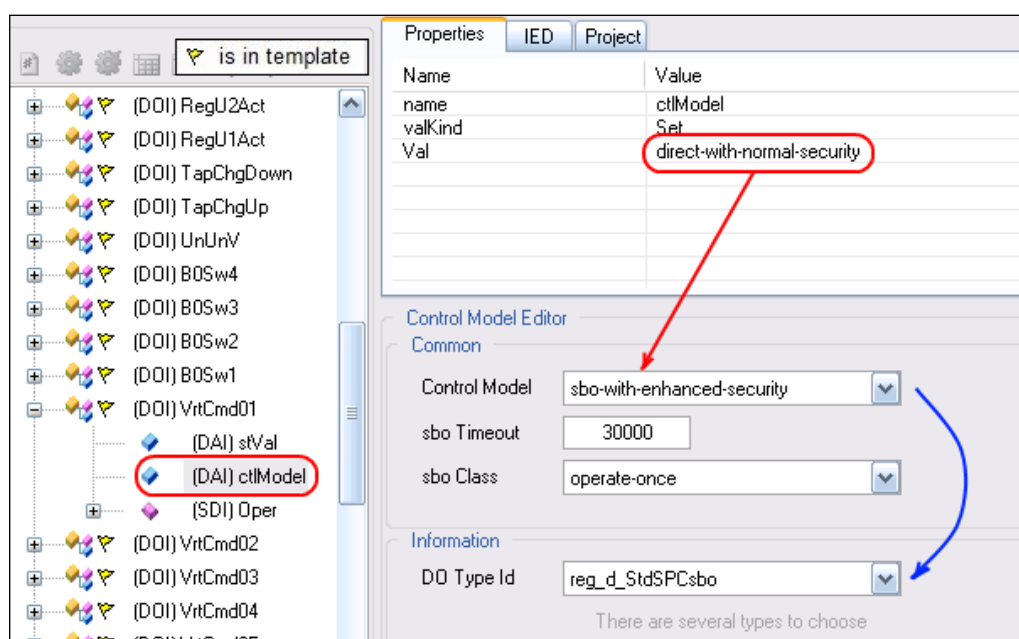

Figure 89: Changing the control model for controllable data objects

User is able to select a control model from the drop-down list “Control Model”. The program finds new DO type for selected model by algorithm:

- 1) New DO type has the same Data Class;
- 2) Direct with normal security requires mandatory Data structure Oper;
- 3) SBO with normal security requires mandatory Data attribute SBO, mandatory Data structure Oper and optional Data structure Cancel. Cancel can be omitted if cancel service is unsupported;
- 4) SBO with enhanced security requires mandatory Data structure SBOw, mandatory Data structure Oper and optional Data structure Cancel. Cancel can be omitted if cancel service is unsupported;
- 5) Direct with enhanced security requires mandatory Data structure Oper and optional Data structure Cancel. Cancel can be omitted if cancel service is unsupported;

Can be searched several types. In this case user can select from choose one.

If “sbo” type is selected, the user is able to edit “sboTimeout” and “sboClass” DAs.

After a confirmation a program changes a type of DO and brings all DAs conformably with selected DO type (fig. 29 & 30).

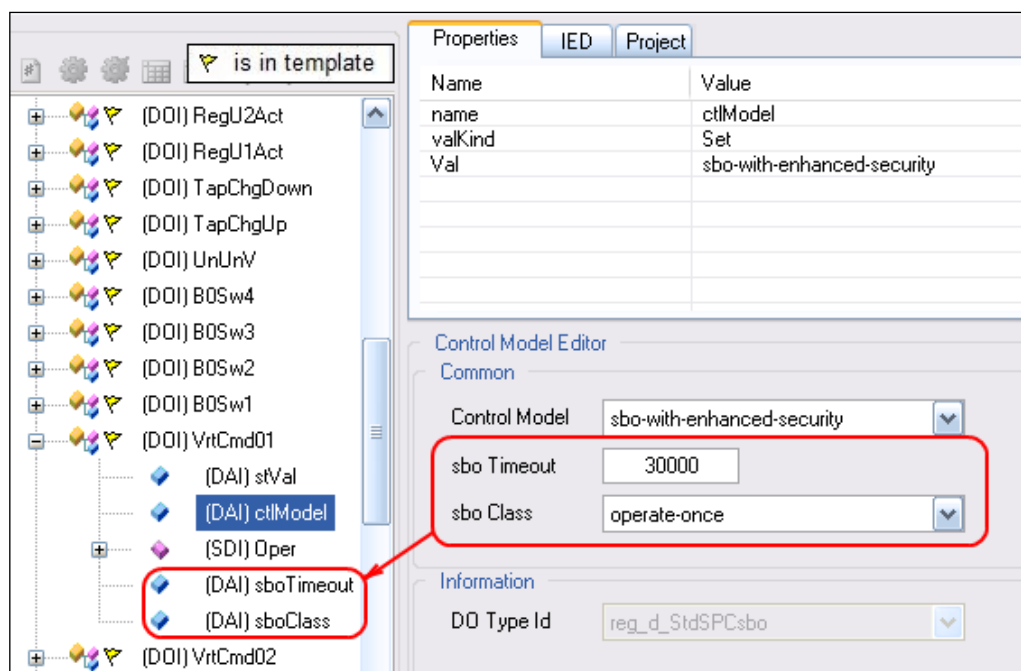

Figure 90: New attributes for selected "sbo" control model

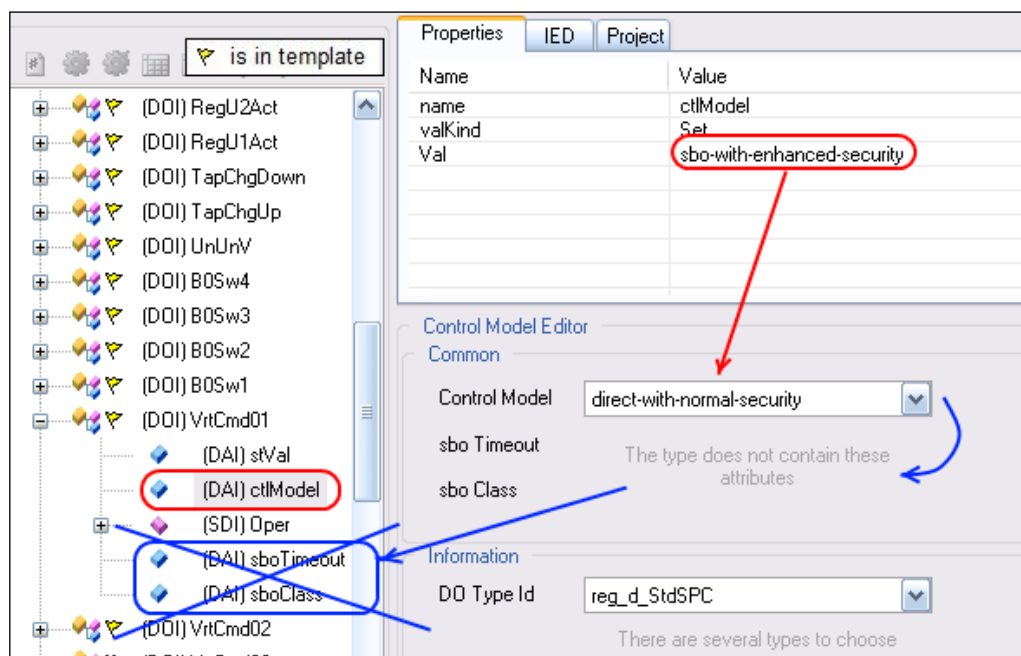

Figure 91: Excluded attributes for selected "direct" control model

18.2.10 GOOSElight Support

GOOSElight contains the settings for Publisher and Subscriber sides. These are different and perform different functions. SCL_Config provides the ability to create, to edit, to adjust and to save all settings for both sides. All functions are available on “GOOSElight” page of application.

All GOOSE settings are saved in form of “param” files:

- 0 for project type “Archive Tar” inside archive (jffs2.tar)
- 0 for project type “WinConfig” in settings file (xml) as CData sections

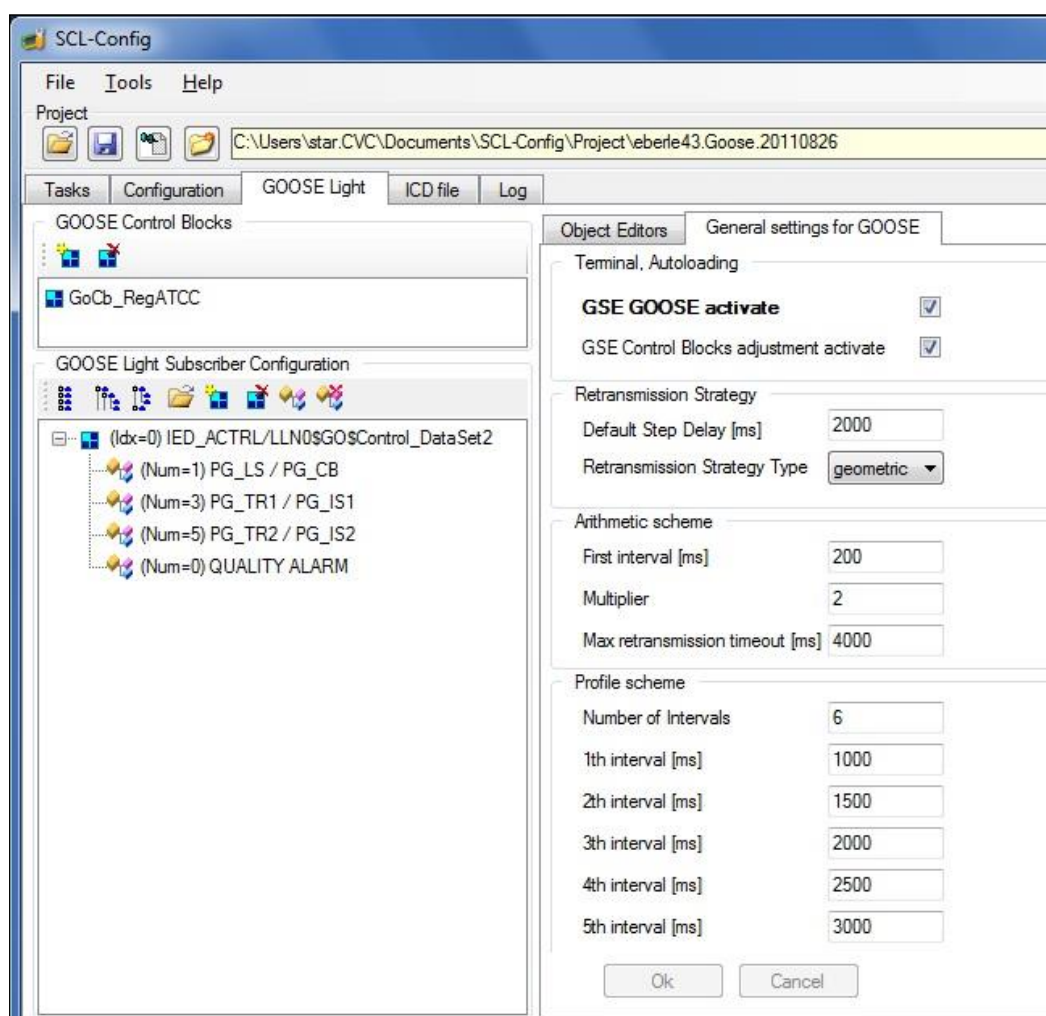

Figure 92: GOOSE settings page

18.2.10.1 Limitations and scope

The GOOSE features are applied only for sAddr type "ASCIIx61850".

Attributes that can be added to the GOOSE publisher Data Set :

- 0 “stVal”,
- 0 “mag.f”,

- 0 "valWTr.transInd",
- 0 "valWTr.posVal",
- 0 "q"

18.2.10.2 Common GOOSE Settings for Publisher side

Editor "General Settings for GOOSE" provides editing common settings - activation, timing strategy, and timing settings.

18.2.10.3 GOOSE Publisher Control Block functions

The GOOSE Publisher Control Block List is available on the "GOOSE Control Blocks" box.

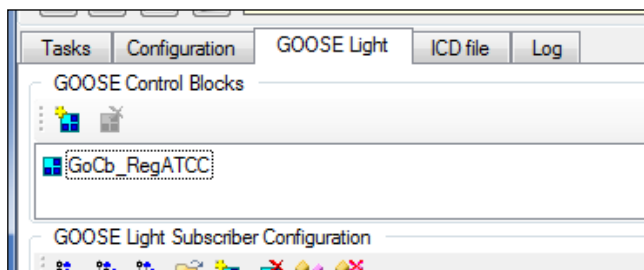

Figure 93: GOOSE Control Blocks list

Selected block can be removed using function "Remove GOOSE Control Block". When user deletes a block, the ICD sections for this block are removed – "GSE", "GSEControl", "DataSet".

Function "Add GOOSE Control Block" will prompt to define the required parameters for the new block. The new block will be shown in the list. The maximum number of blocks is 4.

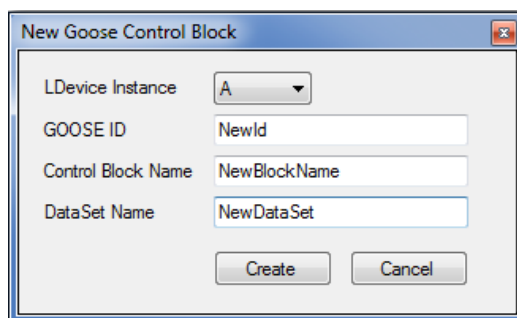

Figure 94: Parameters for the new GOOSE Control Block

18.2.10.4 GOOSE Publisher Control Block settings

For the selected in the list GOOSE control block is available to view and edit the parameters of this block. The properties editor has 3 pages of settings.

Page "Common Settings" allows defining names and descriptions of main sections.

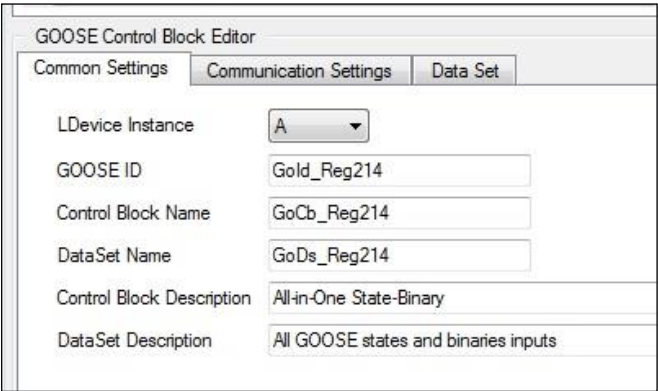

Figure 95: Common settings of the GOOSE Control Block

Page “Communication Settings” allows defining MAC address.

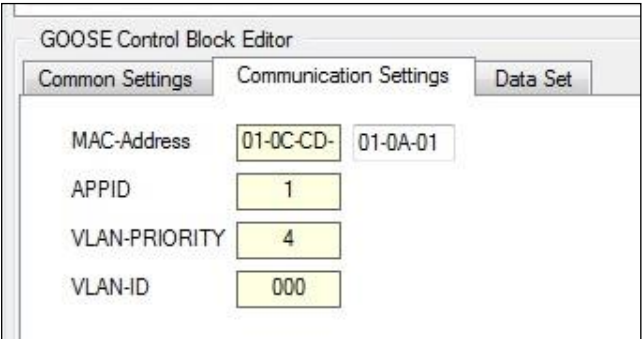

Figure 96: Communication settings of the GOOSE Control Block

Page “Data Set” shows the Data Set of the Control Block and allows editing it. Functions “Data Object Up”, “Data Object Down” and “Remove Data Object” are processing all Data Attributes records for current Data Object. Functions “Data Attribute Up” and “Data Attribute Down” are changing order of Data Attributes records for current Data Object.

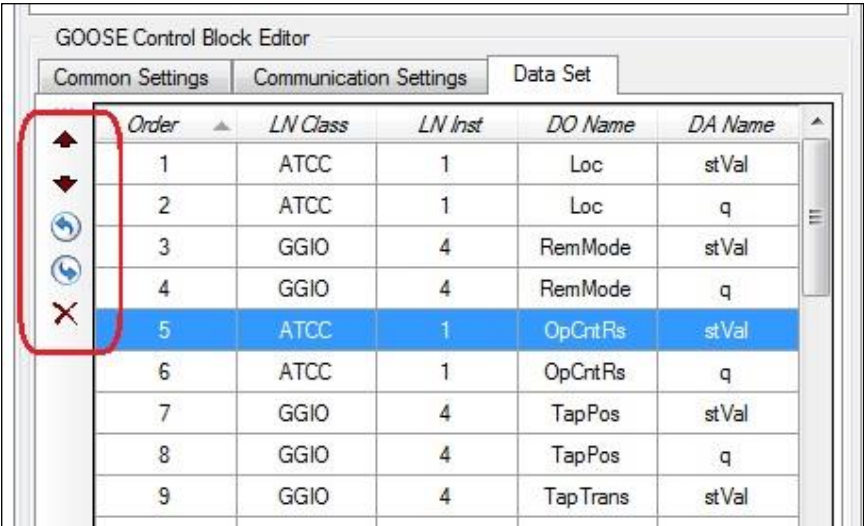

Figure 97: Data Set of the GOOSE Control Block

Adding the Data Object to Data Set of GOOSE Control Block is done in a device tree. For the selected Data Object is used function “Add DO to GOOSE Control Block”.

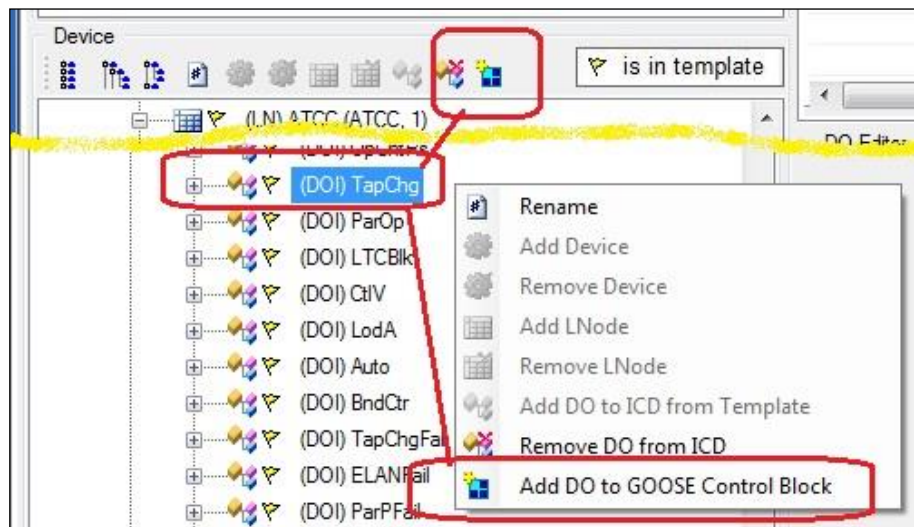

Figure 98: Adding the Data Object to Data Set of GOOSE Control Block

Before adding it will be necessary to select a Control Block and Data Attributes. Attributes list is defined by a Data Object type from template section of ICD.

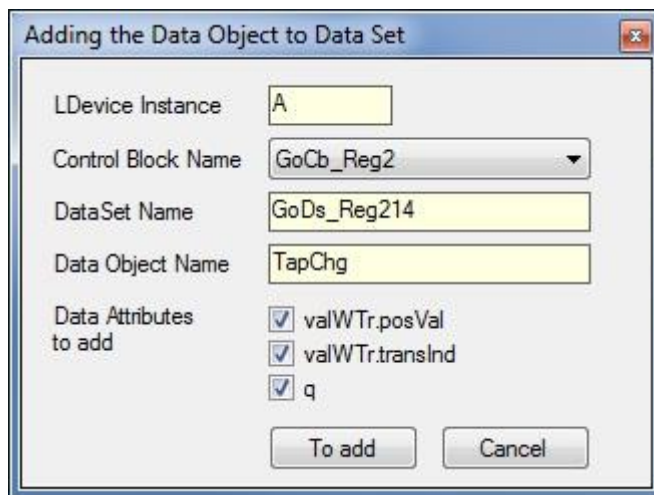

Figure 99: Adding the Data Object to Data Set of GOOSE Control Block

Note: For structure "valWTr" data attribute "q" will be added twice – for each attribute. To Data Set will be added 4 records.

LN Inst	DO Name	DA Name
1	TapChg	valWTr.posVal
1	TapChg	q
1	TapChg	valWTr.transInd
1	TapChg	q

Figure 100: Adding structure "valWTr" to Data Set of GOOSE Control Block

18.2.10.5 GOOSE External Publisher – Internal Subscriber Side

The application contains up to 16 internal subscribers. They are able to receive GOOSE messages from external GOOSE Publisher. Each subscriber can receive the messages from one Publisher. Each subscriber contains a list of the external data objects, which are included in messages from conformed external publisher. Subscribers and data objects are shown as the logical structure tree on box “GOOSE *Light* Subscriber Configuration”.

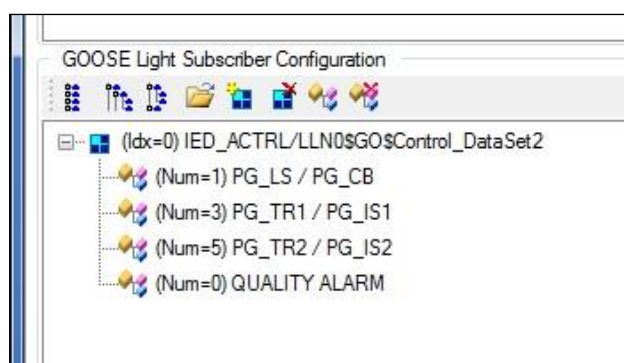

Figure 101: External Publishers List

18.2.10.6 Adding and deleting Subscribers and Data Objects

Use hot-keys and popup menu of the top panel to add new Subscribers and Data Objects or to delete them.

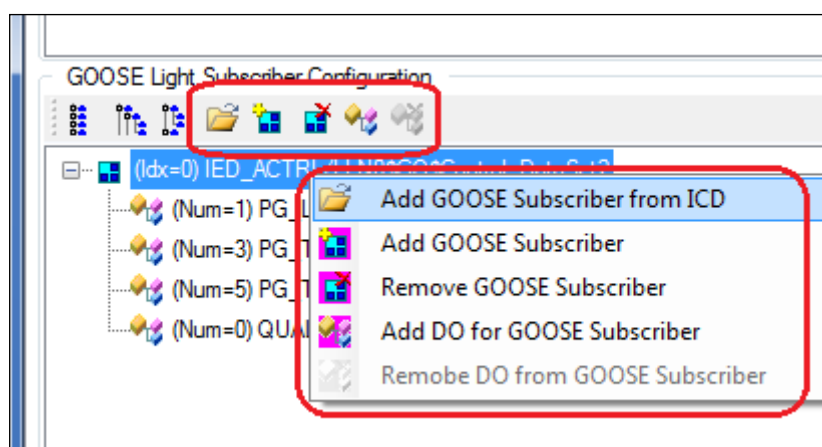

Figure 102: Adding and deleting Subscribers and Data Objects

Communication and GOOSE publisher settings may be got from external ICD. After select this function the new form will be shown. It is need to select ICD-file and GOOSE Control Block from it, to check necessary data objects. Selected control block and data objects will be added as new Subscriber.

Figure 103: Adding Subscribers and Data Objects from ICD-file

18.2.10.7 External Publisher Settings

For selected Subscriber is available settings editor. Logical Devices list contains Logical Devices from ICD of project. If publisher was loaded from external ICD, then GOOSE ID, Control Block and DataSet names, MAC-address will be filled from it.

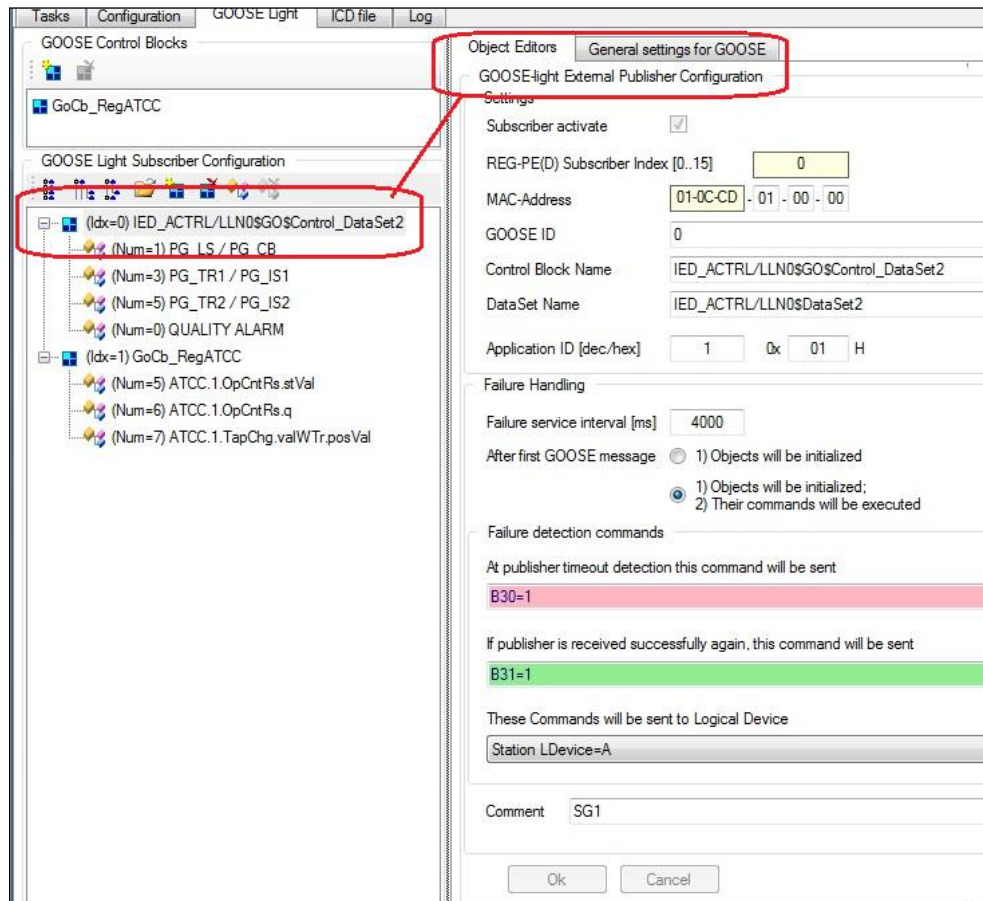

Figure 104: External Publisher Settings

18.2.10.8 External Dataset Object Settings

For selected Data Object is available settings editor. Locked data in form is defined by Subscriber. The behavior of “scale” setting for DoublePoint, Boolean, Quality and other command types is different.

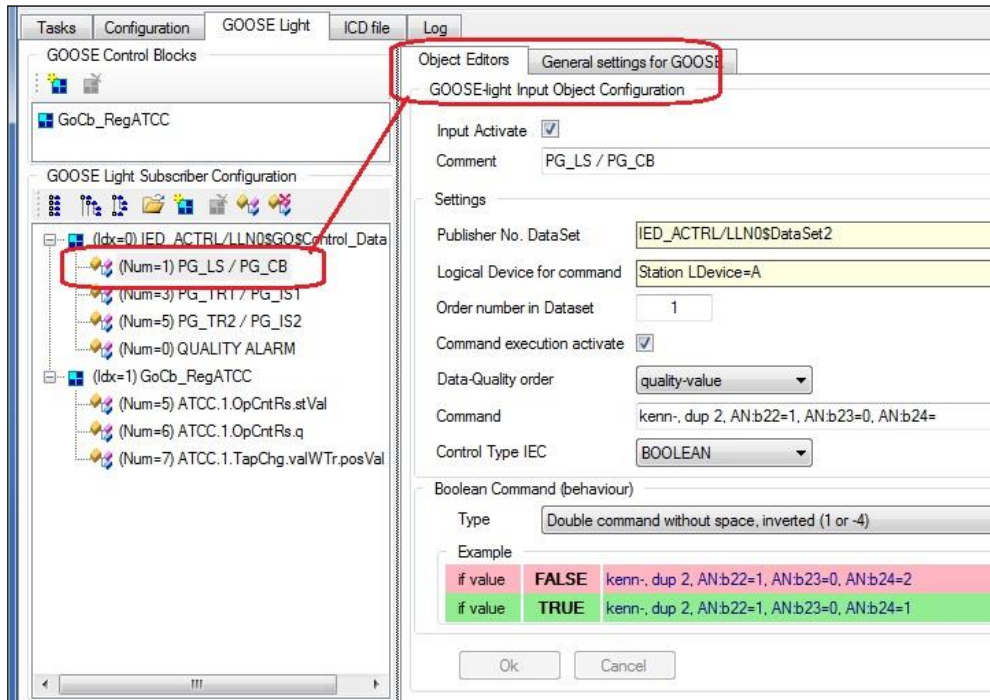

Figure 105: External Dataset Object Settings

18.2.11 Actions log

All events open and save files, add and delete nodes, change sAddr stored in the log file and displayed on the page "Log". Log files saved in "Log" application folder.

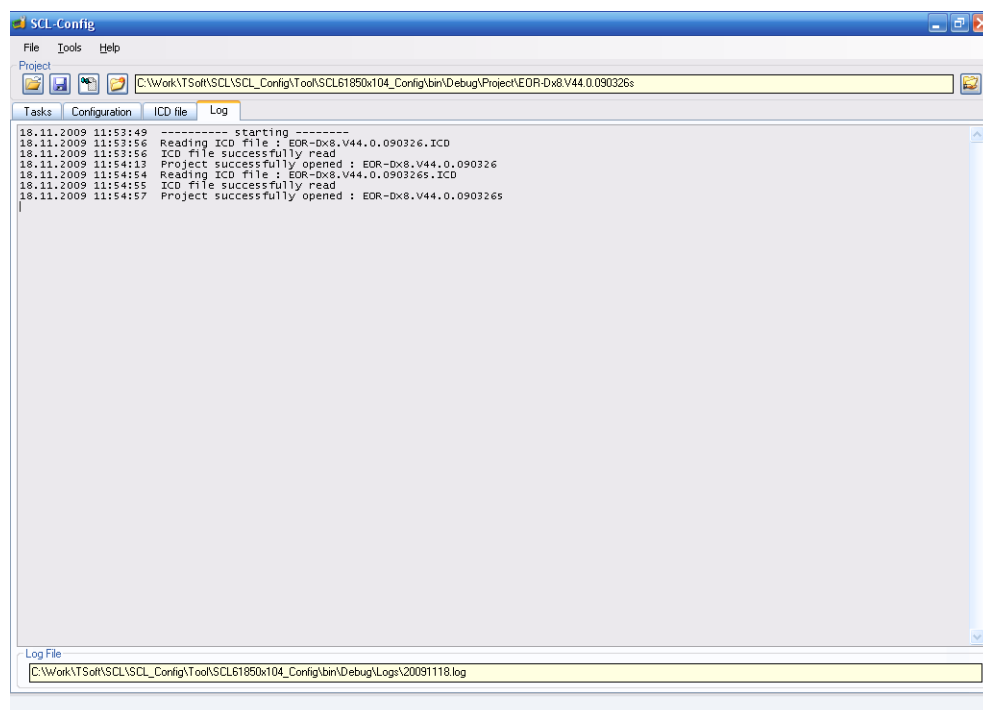

Figure 106: Actions log

18.3 IED-Server Configuration

Within IED-Server Configuration, the IED name and the description can be changed.

The tree view subentries of the server are directly resolved from the name space of the ICD file. This defines that there may be different names for the logical devices and their subordinated Nodes and their subordinated attributes.

That's why only an example can be discussed in the description.

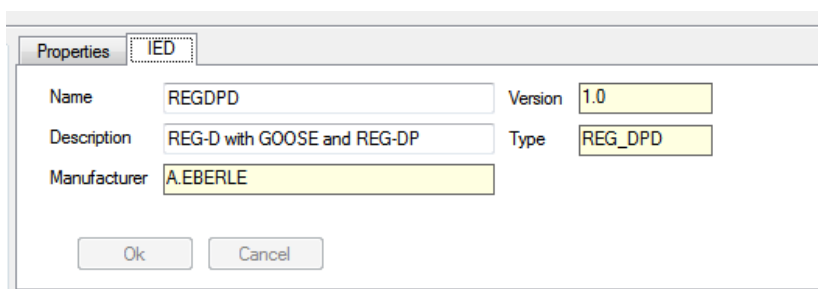

Figure 107: IED Server Description

The length of the IED Name shall be at least one, at maximum 64 characters. It starts with an alpha character, and contains only alphanumeric characters and the underscore character.

Note that there might be more restrictions in other parts of this standard, in IEDs implemented according to previous versions of this standard, or due to usage of this name at engineering time.

18.4 Logical Device Configuration

At the moment only the description of the logical device can be changed. Depending on the ICD file, there are normally two logical devices. The numeric part at the end of the instance name results in the instance number. This instance number has to be related to the physical device in the menu “Devices”. To do this, the field “Device relocation” in the menu “Devices” has to have the same numeric value.

18.5 Logical Node Configuration

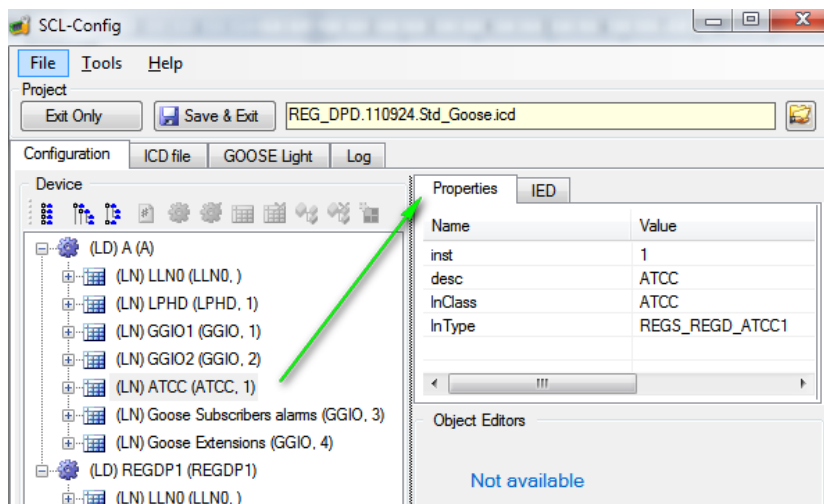

Figure 108: Logical Node Configuration

Typically logical node settings are read only. Depending on the ICD file, all nodes having attributes are shown.

18.6 Common Data Attribute Configuration

The data attributes, which can be parameterized, are passed by the ICD file. These attributes have a private data record of type “sAddr” in field of IED DOI. Since this data record it is already default, e.g. an IEC61850 status value or control value can be parameterized.

There is no user support for directly editing the ICD file. That’s why only the interface of the web server is described. Special courses on ICD file editing for engineers are available at a-Eberle on demand.

18.6.1 Status Value Configuration

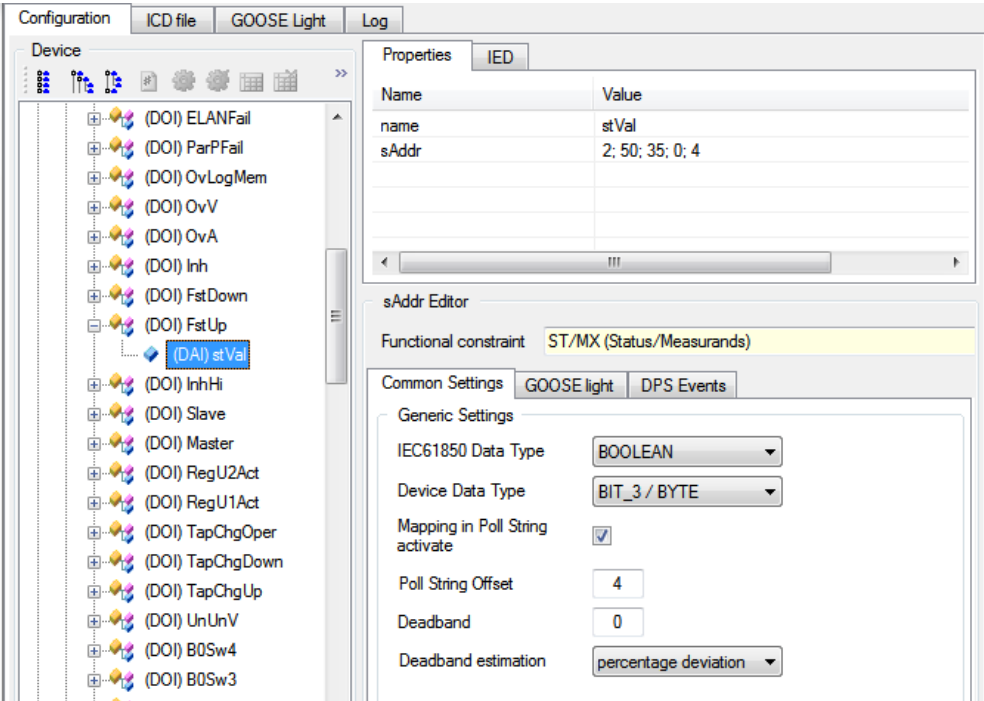

Figure 109: Status Data mapped in device data

IEC-Data point REGD1/LLN0.Mod is not mapped in internal device data (only for example)
The interface changes versus the setting of “Data mapping in device” set or cleared.
For example, in REGSys™ documentation displayed OpCntRs data attribute is described as follow:

				OFFSET	IEC 61850 object
REG-D™/DA measured	unit	REG-Data type	RPS 4		LN ATCC1, Attr .mag.f
Common Tap counter	1	double word	96		OpCntRs

OptCntRs data object is mapped in data of the device and can be imaged in other outside tool or program.

However not mapped *Mod* data attribute is displayed as follows:

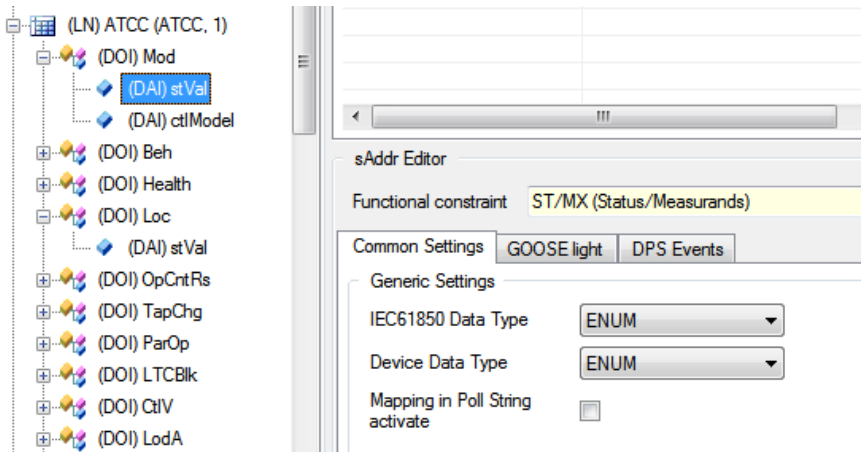

Figure 110: Status Data Point not mapped in device data.

Table 46: Status Data Configuration Data

Form entry	Description
Common	
<i>IEC61850 Data Type:</i>	Defines the corresponding IEC data type.
<i>Mapping in Poll String activate:</i>	The parameter defines the using of data attribute in internal device data. If "No (not mapped in internal data)" has been selected, there is not corresponding offset in internal poll device data.
GOOSElight	
<i>Using as Subscriber timeout-error alarm</i>	The parameter defines the using of data attribute for reporting about timed-out GOOSE telegram, which occurs with waiting timeout expiration.
<i>Number of the observed Subscriber (if set as alarm)</i>	The parameter defines the subscriber index for timeout error reporting
DPS Events	
<i>Auxiliary Group</i>	The parameter defines any auxiliary flag for future using. It is not applicable now
<i>Extended Syntax-Settings</i>	Defines the complex behavior rules and event processing for status object.

18.6.1.1 Extended Lexical Elements Format

To define the complex behavior rules and event processing for status objects there are additional lexical elements, which are used by means of additional extended syntax-settings setting. Any new rule must start with the lexical element.

The character ";" works as a separator between lexical elements. The space character is ignored.

It is necessary to note, that syntactically all language rules are case-insensitive.

The following is a list of used Lexical elements:

- 1) Lexical element \$EVN. It defines data status behavior, if a current event occurs.
- 2) Lexical element \$CMD. **Not used yet.**

Each Lexical element may be composed of keywords, types and values. The character ":" is a delimiter between the separate keywords, types or values.

The three possible keyword groups are:

Table 47: Keyword group for definition the position in poll-string:

Keyword	Description	Values range
Off	offset in poll-string	
Bit	bit-offset begin with offset in poll-string (it is applied only for binary or for Boolean types)	

Table 48: Keyword group for event type definition:

Keyword	Description	Values range
Bool	Boolean or binary type	0,1
Char	Character or signed character type	-128... +127
Byte	Unsigned character type	0.. +255
Unt16	Unsigned two bytes or unsigned short.	0...65535
Word	Signed two bytes or Signed short.	-32768...+32767
ULong	Unsigned four bytes or unsigned long.	0...0xFFFFFFFF
Long	Signed four bytes or signed long.	-0x7FFFFFFF...0x7FFFFFFF
Float	IEEE 754: floating point	bytes

Table 49: Keyword group for definition the directed-behaviour in directional protection activation information (ACD)

Keyword	Description	Values range
Back	Backward from IEC61850 enumeration "dir".	Without value
For	Forward from IEC61850 enumeration "dir".	Without value
Both	Both from IEC61850 enumeration "dir".	Without value

Table 50: Keywords group for definition complex data object behaviour

Keyword	Description	Values range
Clear	Event clears the status object (to 0)	Without value
Set	Event sets the status object (to one)	Without value
Value	Event sets encapsulated value to the status object	Without value
DpHi	Event answers to the purpose "Higher" in complex DPS data status. It sets anyway its TRUE as [10] by means "any or all gate"	Without value
DpLo	Event answers to the purpose "Lower" in complex DPS data status. It sets anyway its TRUE as [01] by means "any or all gate"	Without value

18.6.1.2 Mapping with Extended Lexical Elements

Here there are some examples shortly of the different ways to use this notification.

0 Example: DPS complex status object mapping

Extended syntax-setting is:

\$Evn:Bool:Off=19:Bit=0:DpHi; \$Evn:Bool:Off=19:Bit=1:DpLo

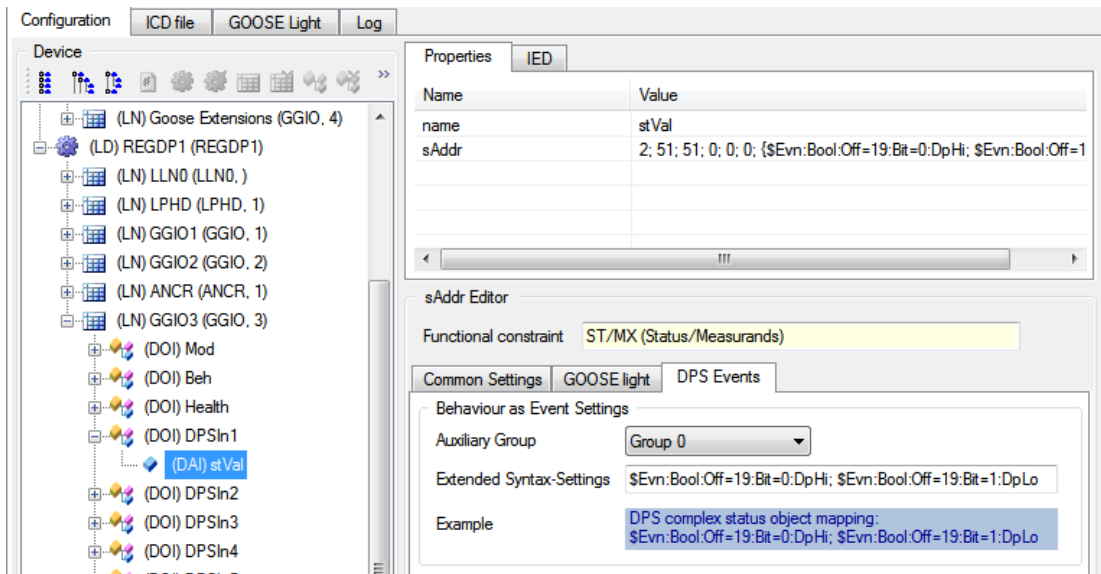

Figure 111: Example of DPS-complex status

- IEC61850 type is “DoublePoint” (enumeration DPOs);
- Device internal type is inapplicable, because this status is not mapped in internal data and is not arranged in the poll-string;
- First Event(**\$Evn:Bool:Off=19:Bit=0:DpHi**) defines internal SPS-data: offset 19, bit offset 0. Its behavior fits with DPS-Higher request. If this SPS (status point) is set to TRUE, value [10] will be set by means “any or all gate” after clear of high byte. If this SPS (status point) is set to FALSE, high bit will be cleared.
- Second Event(**\$Evn:Bool:Off=19:Bit=1:DpLo**) defines internal SPS-data: offset 19, bit offset 1. Its behavior fits with DPS-Lower request. If this SPS (status point) is set to TRUE, value [01] will be set by means “any or all gate” after clear of lower bit. If this SPS (status point) is set to FALSE, low bit will be cleared.

0 Example: Status object by means directional protection activation

Extended syntax-setting is:

\$Evn:Bool:Off=19:Bit=0:Forw; \$Evn:Bool:Off=19:Bit=1:Back; \$Evn:Bool:Off=19:Bit=3:Both

- IEC61850 type is “DoublePoint” (enumeration “dir”);

```
<EnumType id="dir">
  <EnumVal ord="0">unknown</EnumVal>
  <EnumVal ord="1">forward</EnumVal>
  <EnumVal ord="2">backward</EnumVal>
  <EnumVal ord="3">both</EnumVal>
</EnumType>
```

- Device internal type is inapplicable, because this status is not mapped in internal data and is not arranged in the poll-string;
- First Event(**\$Evn:Bool:Off=19:Bit=0:Forw**) defines internal SPS-data event: offset 19, bit offset 0. Its behaviour fits with Dir-enumeration type in IEC61850. If this SPS (status point) is set to TRUE, value 1 will be set. Value FALSE ignored.
- Second Event(**\$Evn:Bool:Off=19:Bit=1:Back**) defines internal SPS-data event: offset 19, bit offset 1. Its behaviour fits with Dir-enumeration type in IEC61850. If this SPS (status point) is set to TRUE, value 2 will be set. Value FALSE ignored.
- Third Event(**\$Evn:Bool:Off=19:Bit=2:Both**) defines internal SPS-data event: offset 19, bit offset 2. Its behaviour fits with Dir-enumeration type in IEC61850. If this SPS (status point) is set to TRUE, value 3 will be set. Value FALSE ignored.

0 Example: Triggered status object

Extended syntax-setting is:

\$Evn:Bool:Off=19:Bit=0:Set; \$Evn:Bool:Off=19:Bit=1:Clear

- IEC61850 type is BOOLEAN
- Device internal type is inapplicable, because this status is not mapped in internal data and is not arranged in the poll-string;
- First Event(**\$Evn:Bool:Off=19:Bit=0:Set**) defines internal SPS-data event: offset 19, bit offset 0. If this SPS (status point) is set to TRUE, value 1 will be set. Value FALSE ignored.
- Second Event(**\$Evn:Bool:Off=19:Bit=1:Clear**) defines internal SPS-data event: offset 19, bit offset 0. If this SPS (status point) is set to TRUE, value 0 will be set. Value FALSE ignored.

18.6.2 Control Value Configuration

The operate request is performed through the use of a **Write.request** of the appropriate **Oper** structure.

The Oper\$ctlVal settings and executing behaviour are defined in “Control Value Configuration” section.

The parameter Oper\$Check specifies the kind of checks a control object and is defined only in ICD file. All conditional tests before and after the control operations are adjustable and defined below.

18.6.2.1 Single Command

Here “*Multi-Command*” is not checked. If it is checked, the mode will be changed to “*Multi Command*”.

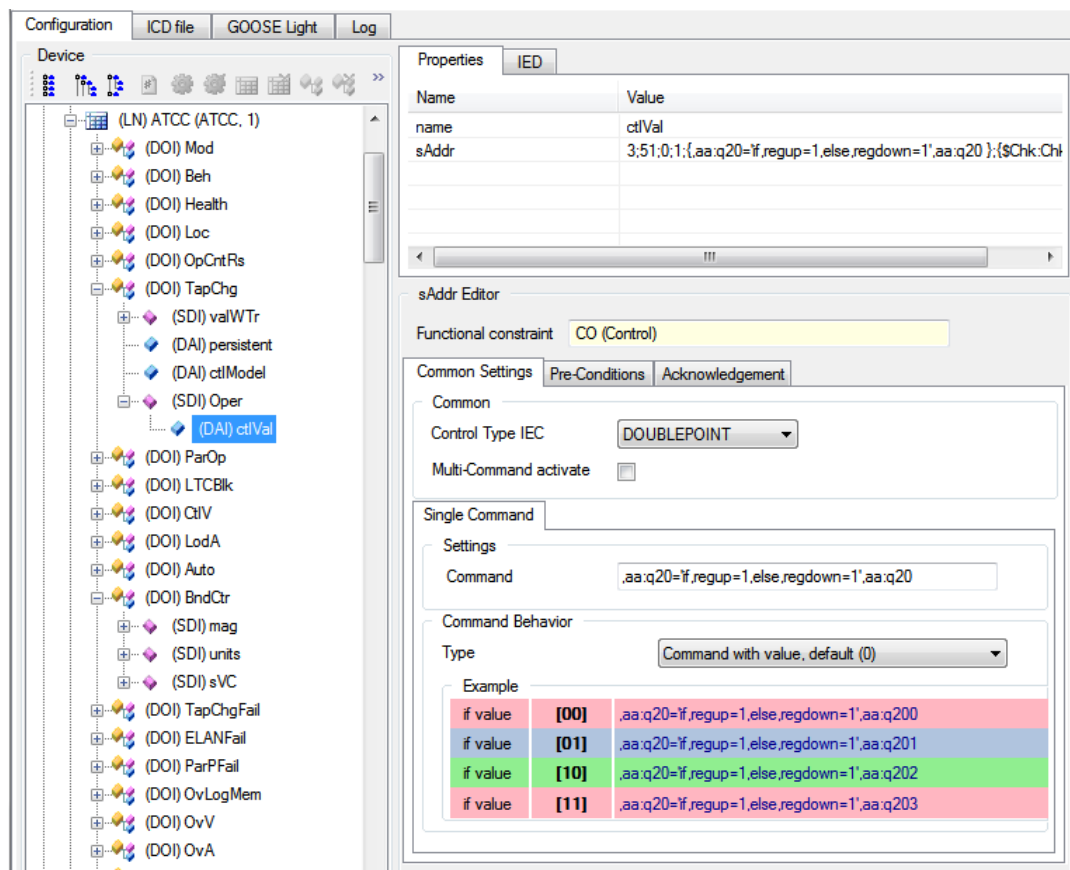

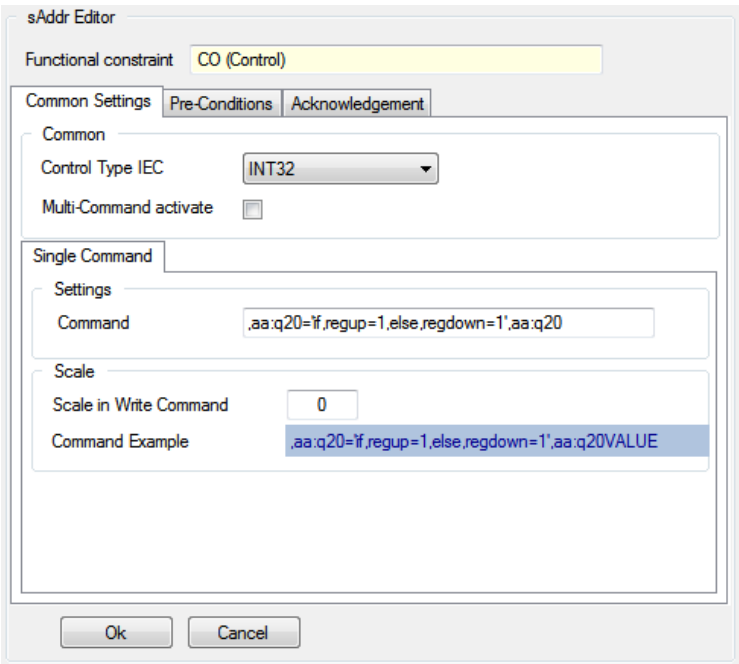

Figure 112: Control Value Configuration (Single Command)

Table 51: Control value settings

Form entry	Description
Common	
Control Type IEC	Defines the corresponding IEC control data type.
Multi-command	The parameter defines using of the multi command CO-data attribute. Leave unchecked for single command
Single command	
Field Section "XXXX-Command"	<p>Normally, this parameter is used as exponent with single commands. If a Boolean or DoublePoint IEC control data type is used, scale has special meaning. (See below)</p> <p>The parameter can be adjusted from -127...128. By default set to 0.</p>

We take care of it.

Form entry	Description
	<p>Command</p> <p>Defines the command string, which is assigned with converted IEC control value of scale rule. The result is sent to XXXSysTM – device.</p>

If IEC-Type of command is BOOLEAN, scale parameter will be used as shown below:

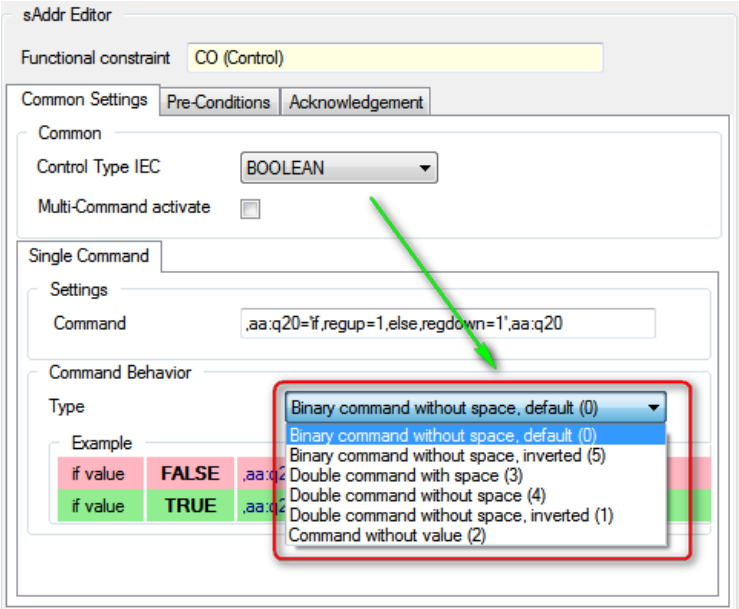

Table 52: Boolean conversion rules for [command] [convert (ct/Val)]

Scale	IEC Value	Conversion
1	False	[command][2]
1	True	[command][1]

Command Behavior

Type Double command without space, inverted (1)

Example

if value	FALSE	,aa:q20=if,regup=1,else,regdown=1',aa:q202
if value	TRUE	,aa:q20=if,regup=1,else,regdown=1',aa:q201

2	False/True	[command]
---	------------	-----------

Settings

Command ,aa:q20=if,regup=1,else,regdown=1',aa:q20

Command Behavior

Type Command without value (2)

Example

if value	FALSE	,aa:q20=if,regup=1,else,regdown=1',aa:q20
if value	TRUE	,aa:q20=if,regup=1,else,regdown=1',aa:q20

3	False	[command][space][1]
3	True	[command][space][2]

Single Command

Settings

Command ,aa:q20=if,regup=1,else,regdown=1',aa:q20

Command Behavior

Type Double command with space (3)

Example

if value	FALSE	,aa:q20=if,regup=1,else,regdown=1',aa:q20 1
if value	TRUE	,aa:q20=if,regup=1,else,regdown=1',aa:q20 2

We take care of it.

Scale	IEC Value	Conversion
-------	-----------	------------

4	True	[command][2]
4	False	[command][1]

Single Command

Settings

Command

,aa:q20=if,regup=1,else,regdown=1',aa:q20

Command Behavior

Type

Double command without space (4)

Example

if value	FALSE	,aa:q20=if,regup=1,else,regdown=1',aa:q201
if value	TRUE	,aa:q20=if,regup=1,else,regdown=1',aa:q202

5	False	[command][1]
5	True	[command][0]

Single Command

Settings

Command

,aa:q20=if,regup=1,else,regdown=1',aa:q20

Command Behavior

Type

Binary command without space, inverted (5)

Example

if value	FALSE	,aa:q20=if,regup=1,else,regdown=1',aa:q201
if value	TRUE	,aa:q20=if,regup=1,else,regdown=1',aa:q200

Scale	IEC Value	Conversion
-------	-----------	------------

Default 0	False	[command][0]
Default 0	True	[command][1]

Single Command

Settings

Command: ,aa:q20=if,regup=1,else,regdown=1',aa:q20

Command Behavior

Type: Binary command without space, default (0)

Example

if value	FALSE	,aa:q20=if,regup=1,else,regdown=1',aa:q200
if value	TRUE	,aa:q20=if,regup=1,else,regdown=1',aa:q201

If IEC-Type of command is DOUBLEPOINT, scale parameter will be used as shown below:

Common Settings Pre-Conditions Acknowledgement

Common

Control Type IEC: DOUBLEPOINT

Multi-Command activate: ☐

Single Command

Settings

Command: ,aa:q20=if,regup=1,else,regdown=1',aa:q20

Command Behavior

Type: Command with value, default (0)

Example

if value	[00]	,aa:q20=if,regup=1,else,regdown=1',aa:q20
if value	[01]	,aa:q20=if,regup=1,else,regdown=1',aa:q20
if value	[10]	,aa:q20=if,regup=1,else,regdown=1',aa:q20
if value	[11]	,aa:q20=if,regup=1,else,regdown=1',aa:q203

Table 53: Double Point conversion rules for *[command][convert(ct/Val)]*

Scale	IEC Value	Conversion
1	[00]	Negative response.
1	[01]	[command][0]
1	[10]	[command][1]
1	[11]	Negative response.
2	[00]	[command][0]
2	[01]	[command][1]

2	[11]	Negative response.
3 (unused value. Instead of this a default value is used)	[00]	[command][0]
	[01]	[command][1]
	[10]	[command][2]
	[11]	[command][3]
4	[00]	Negative response.
4	[01]	[command][1]
4	[10]	[command][0]
4	[11]	Negative response.
5	[00]	Negative response.
5	[01]	[command][2]
5	[10]	[command][1]
5	[11]	Negative response.
Default	value	[command][value]

18.6.2.2 Multi Command

Here the check box for “Multi-command” is checked. If it gets unchecked, the mode will be changed to “Single Command”.

This mode is only available for Boolean and DoublePoint commands.

Multi-command mode has been left for backward compatibility and will not be supported in future.

Figure 113: Control Value Configurations (Multi Command)

Multi commands are built, as a chain of the comma-separated commands. For example, commands No.1 and No.2 create the multi-command:

A: regAUTO=1, ,aa:q20='if,regup=1,else,regdown=1', aa:q20'

Table 54: Multi command control value settings

Form entry	Description
Common	
<i>IEC-type of control</i>	Defines the corresponding IEC control data type.
<i>Multi-Command activate</i>	The parameter defines using of the multi command CO-data attribute. Leave unchecked for single command
Single command	
<i>Scale</i>	Normally, scale is used as exponent with single commands. If a Boolean/Double IEC control data type is selected, scale has special meaning. (See following tables.) The parameter can be adjusted from -127...128. By default set to 0.
<i>Command</i>	Defines the command string, which is assigned with converted IEC control value of scale rule. The result is sent to XXXSys™ – device.

18.6.2.3 Pre-Conditions

Command pre-conditions define the behavior of check before the control operation. They are checked each time before control operation.

The screenshot shows a software interface with three tabs: 'Common Settings', 'Pre-Conditions', and 'Acknowledgement'. The 'Pre-Conditions' tab is active, showing three sub-tabs: 'Condition No.1', 'Condition No.2', and 'Condition No.3'. Under 'Condition No.1', there is a dropdown menu set to 'Same as Checked Value'. Below this is an 'Extended Settings' section with several fields: 'Checked Data Point Type' (dropdown set to 'BIT_7 / BYTE'), 'Poll String Offset' (text box with '3'), 'Checked Value (optional)' (text box with '1'), 'Minimal Position (optional)' (text box with '0'), 'Maximal Position (optional)' (text box with '0'), 'Allowed Command Value to leave minimal Position' (text box with '0'), 'Allowed Command Value to leave maximal Position' (text box with '0'), and 'Additional Cause Diagnosis (IEC61850-8.1 AddCause)' (dropdown set to 'Blocked-by-Mode').

Figure 114: Executing Command Pre-Conditions

- 0 If predictable condition check finished successful, control operation continues and command will be sent to device.
 - 0 If predictable condition check faulted, application sends “response-” and an information report with Last Error cod to client according to a selected control model in ICD file.
- Even if a part of checks finished successful, command will be never sent, if at least one condition faulted.

Selector “Condition” defines a predictable type by mean of test-behavior.

This screenshot shows the 'Condition Type (behavior)' dropdown menu from the previous figure. The menu is open, displaying the following options: 'Same as Checked Value' (highlighted), 'disable', 'Same as Command Value', 'Other than Command Value', 'Same as Checked Value' (highlighted), 'Other than Checked Value', 'Within Limits', and 'Outside Limits'. The background shows the 'Condition No.1' tab and the 'Extended Settings' section.

Figure 115: Condition Type (behavior)

Extended Settings define test behavior and data point, which will be checked. The maximal and minimal limit position can be defined too.

Extended Settings

Checked Data Point Type

Poll String Offset

Checked Value (optional)

Minimal Position (optional)

Maximal Position (optional)

Allowed Command Value to leave minimal Position

Allowed Command Value to leave maximal Position

Additional Cause Diagnosis (IEC61850-8.1 AddCause)

Figure 116: Condition extended Settings

Table 55: Predicable Condition Extended Settings

Form entry	Description
Checked data Point Type	Defines a checked Data Point type in Poll string.
Poll String Offset	Defines a checked Data Point Poll string offset.
Checked Value(optional)	Defines a checked value as FLOAT32 value
Minimal Position (optional)	Defines minimal position by "Limit condition"
Maximal Position (optional)	Defines maximal position by "Limit condition"
Allowed Command Value to leave minimal Position	Defines command value, that permitted at minimal position by "Limit condition"
Allowed Command Value to leave maximal Position	Defines command value, that permitted at maximal position by "Limit condition"

18.6.2.4 Command Acknowledgement

Command Acknowledgement condition defines a check behavior after command executing.

Common Settings Pre-Conditions Acknowledgement

Extended Settings

Check Behaviour

Data Point Type

Poll String Offset

Set Point (optional)

Figure 117: Acknowledgement Condition Settings

Table 56: Command Acknowledgement

Form entry	Description
Check Behavior	Defines the estimation behavior
Data Point Type	Defines test data point type in poll string
Poll String Offset	Defines test data point offset in poll string
Set Point (optional)	Optional defines the test value. For example 0 for reset command.

We take care of it.

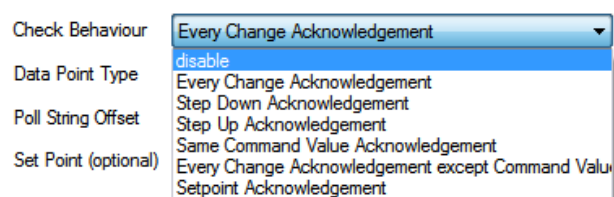

Figure 118: ACK-NACK test behavior

The check behaviors are same as in predicable condition. However, there is “Setpoints..” condition, which literal meaning same with name.

18.6.2.5 Control Model

Parameter `ctlModel` specifies the control model of IEC 61850-7-2 that corresponds to the behavior of the data. The configured value for `ctlModel` becomes effective as soon as the real device has been configured. The values may be overwritten in Webserver if the conditions and acknowledgment allow overwriting this value. If a data instance of a control class has no status information associated, then the attribute `stVal` does not exist. In that case, the value range for `ctlModel` is restricted to `direct-with-normal-security` and `sbo-with-normal-security`.

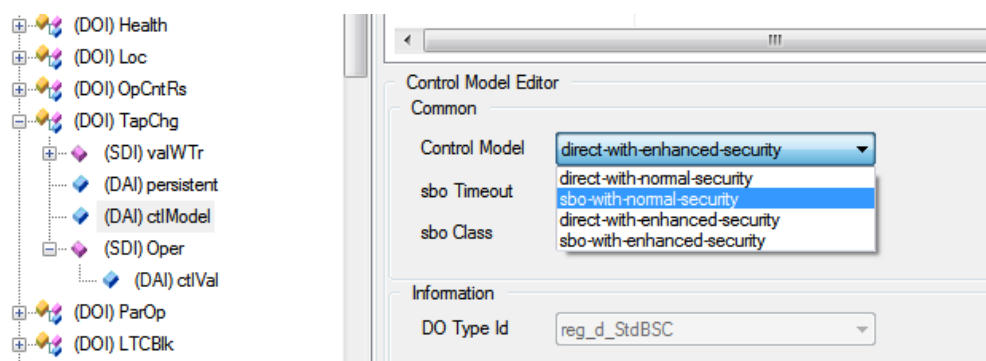

Figure 119: Control Model Parameter

18.6.3 Set point Value Configuration (Single Command)

Set point values are to be configured as a mixed form of a status value and a command.

Here the check box “Multi Line” is not checked. If it gets checked, the mode will be changed to “Multi Command”.

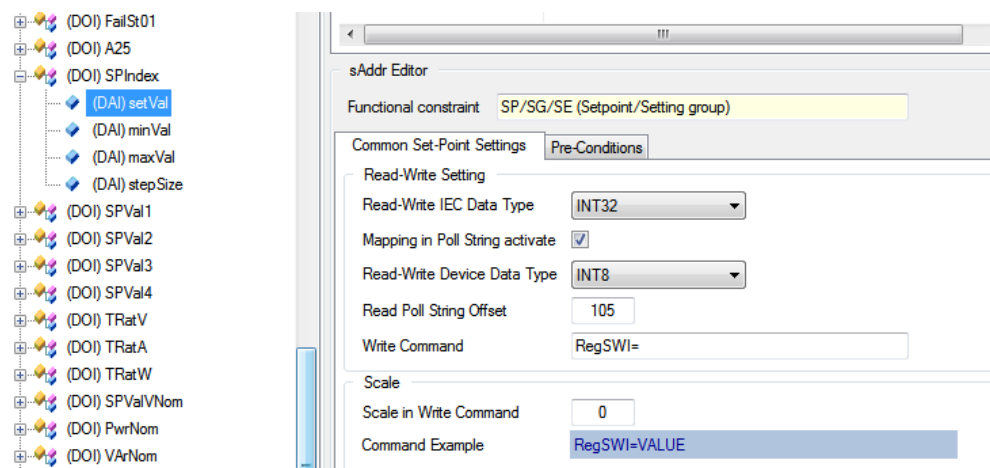

Figure 120: Set point Value Configuration (only with Single Command)

Table 57: Single command Set point settings

Form entry	Description
Common (Status and Measured)	
<i>Read-Write IEC Data Type</i>	Defines the corresponding IEC control data type.
<i>Mapping in Poll String activate:</i>	The parameter defines using this data attribute in internal device data. If “No (not mapped in internal data)” has been selected, there is not corresponding offset in internal poll device data.
<i>Read-Write Device Data Type:</i>	Defines the corresponding XXXSysTM – device data type. If “IGNORE” is selected or “Deviation and offset are used” is not checked, this data point is not allocated. Device data type determines the interpretation of “Deviation”
<i>Read Poll String Offset</i>	Defines offset of the device answer string, where this data is located. If -1, the data point will not be mapped to the answer string. The parameter can be adjusted from -1...255. By default it is -1.
<i>Scale in Write Command</i>	Normally, scale is used as exponent with single commands. If a Boolean IEC control data type is selected, scale has special meaning. (See following tables.) The parameter can be adjusted from -127...128. By default set to 0.
<i>Write Command:</i>	Defines the command string, which is assigned with converted IEC control value of scale rule. The result is sent to XXXSysTM – device.
GOOSE light	
<i>Subscriber Number (if activated):</i>	The parameter defines any auxiliary flag for future using. It is not applicable now.
Pre-Conditions	
<i>Checked data Point Type</i>	Defines a checked Data Point type in Poll string.
<i>Poll String Offset</i>	Defines a checked Data Point Poll string offset.
<i>Checked Value(optional)</i>	Defines a checked value as FLOAT32 value
<i>Minimal Position (optional)</i>	Defines minimal position by “Limit condition”
<i>Maximal Position (optional)</i>	Defines maximal position by “Limit condition”
<i>Allowed Command Value to leave minimal Position</i>	Defines command value, that permitted at minimal position by “Limit condition”
<i>Allowed Command Value to leave maximal Position</i>	Defines command value, that permitted at maximal position by “Limit condition”

18.7 GOOSE *light* Settings

18.7.1 IEC GOOSE *light* Architecture

The implementation of the IEC 61850 GOOSE services provides a mechanism for sending and receiving the standardized GOOSE telegrams. The settings and architectures are quite similar for publisher and subscribers.

It is assumed that the reader is familiar with the GOOSE *light* architecture.

18.7.2 GOOSE *light* Control Blocks Settings

```
<Communication>
  <SubNetwork name="SUBNETWORK1" type="8-MMS">
    <BitRate unit="b/s">100</BitRate>
    <ConnectedAP iedName="REGDA" apName="P1">
      <Address>
        <P type="OSI-PSEL">00000001</P>
        <P type="OSI-SSEL">0001</P>
        <P type="OSI-TSEL">0001</P>

Figure 122: Capture fragment of GOOSE light telegram

18.7.3 GOOSE *light* Input Streams (Inner Subscribers)

The application allows the configuration of up to 15 GOOSE *light* input streams.

The architecture of GOOSE *light* subscribing is shown in Figure 123: .

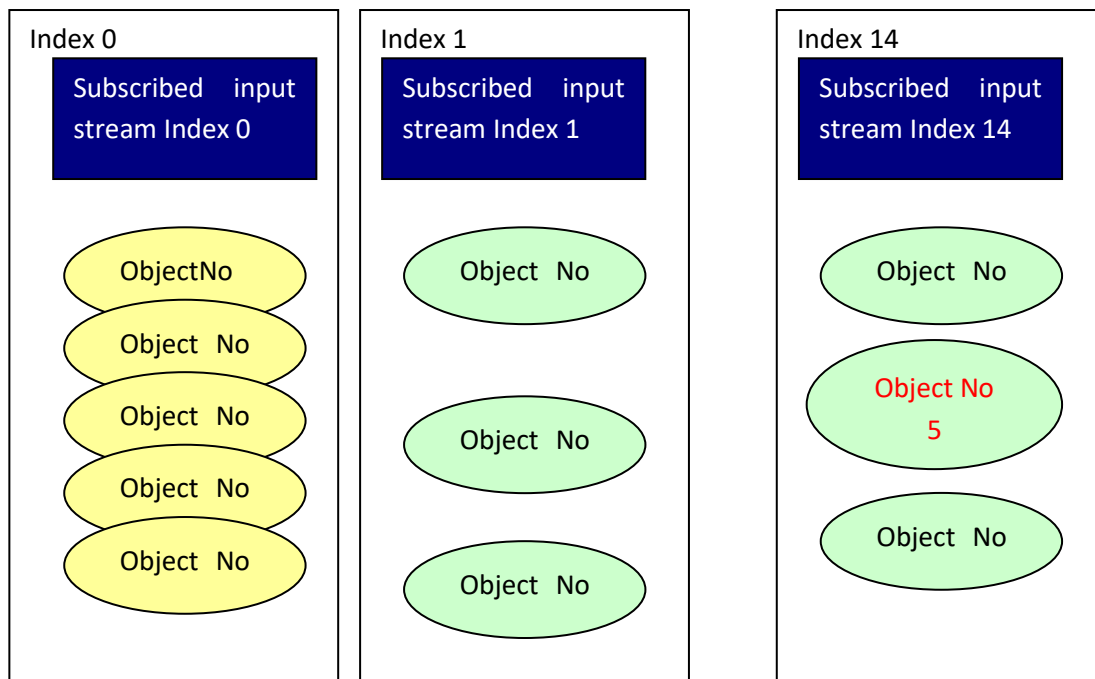

Figure 123: GOOSE *light* Input architecture

Each subscriber holds one set of objects in sequence order. Each object of the subscribed set is given a particular number in received GOOSE *light* telegram. If the subscriber has not been configured in numerical order, its input telegrams cannot be handled in an application. More detailed information is available below.

18.7.4 Publisher Side

The current paragraph illustrates the generic Object Oriented Substation Event configuration within the MMS server and SCL which defined in ICD file in your settings.

The GOOSE *light* configuration database contains settings with the following data elements:

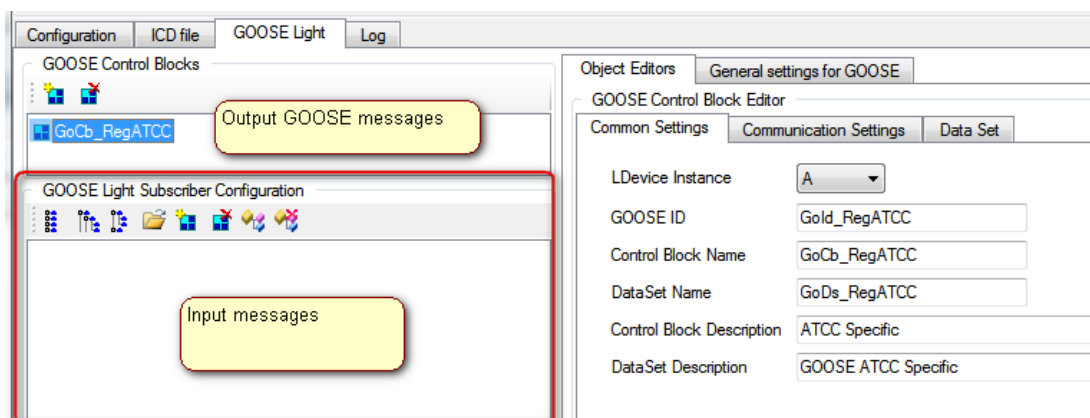

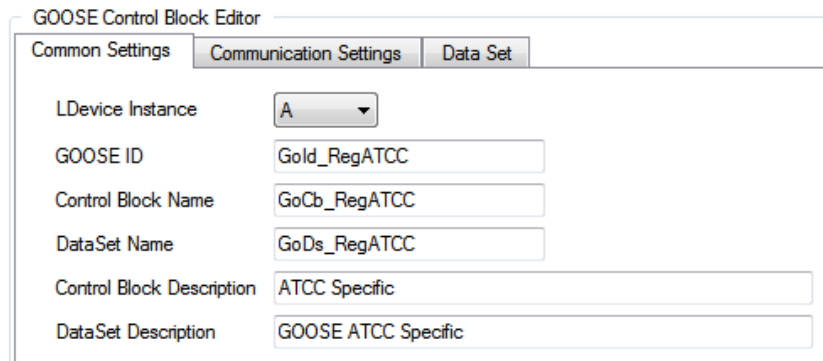

Figure 124: Publisher and Subscriber sides

Adjusted GOOSE settings will be saved to file `goose.param`. At the same time an ICD-file contains the factory GOOSE settings. You should also take that into account.

All changed parameters are available only after resetting the REG-PE/REG-PED.

The screenshot shows the 'GOOSE Control Block Editor' window with three tabs: 'Common Settings', 'Communication Settings', and 'Data Set'. The 'Common Settings' tab is active. It contains the following fields:

LDevice Instance	A
GOOSE ID	Gold_RegATCC
Control Block Name	GoCb_RegATCC
DataSet Name	GoDs_RegATCC
Control Block Description	ATCC Specific
DataSet Description	GOOSE ATCC Specific

Figure 125: "Common Options" Tab

There are two Timing strategy types: arithmetic and profile.

The arithmetic scheme has three parameters: first interval, multiplier, and maximum interval. The first retransmission occurs after the first interval time. Each subsequent interval is the product of the last interval times the multiplier, until the maximum interval is reached. Thus, for first interval = 400, multiplier = 2, and maximum interval = 3200, the retransmissions will occur at intervals beginning at 2, and doubling each time until the maximum interval is reached (400, 800, 1600, 3200). If any changes of GOOSE data occur the application immediately sends GOOSE data and then resets the retransmission time to interval to first interval.

The profile scheme allows for a specific set of intervals to be specified. Each interval (specified in milliseconds) is used in sequence of GOOSE *light* telegrams. When the last specified interval has been used, the parameters of the arithmetic scheme are then used for subsequent intervals (including the maximum retransmission interval).

If any changes of GOOSE *light* data occur, the application immediately sends GOOSE data and then resets the retransmission time to interval to first interval.

Figure 126: GOOSE Retransmission Settings Tab

Firmware supports up to 4 Control Blocks. Their number is defined of ICD Communication Section. For example, if an ICD file contains the 3 GOOSE GSEs, only these GOOSE Control blocks will be shown here.

The settings data elements are described in the table below.

Table 58: Settings of GOOSE *light*

Name	Unit	Range	Standard value	Description
Common				
GSE GOOSE activate	Used/ Not used		Used	Parameter activates/deactivates IEC GOOSE service. If GOOSE won't be used, the service will be deactivated. It can reduce a network busy schedule. <div>  Setting "No" switches off all GOOSE services. </div>
GSE Control Blocks adjustment activate	Y/N	Yes/ No (use only MMS-Goose Control Blocks)	No	Parameter activates/deactivates an adjustment of the published IEC GOOSE Control Blocks, which have been described in the ICD file. If "No" is selected, REG-PE/REG-PED publishes all GOOSE Control Blocks as this has been described in ICD-file. <p>If the adjustment has been deactivated, all following APPID and VLAN settings won't be applied.</p>

Name	Unit	Range	Standard value	Description
MAC Address (destination of GOOSE messages)	hex	6 octet	IEC61850-8	Parameter defines the multicast data link destination address for a first IEC GOOSE Control Block from GSE-Section in ICD file.
Application ID	Hex/dec	From 0 up to 2^{32}	0x3ED or 1001 in decimal notation	The parameter defines VLAN APPLD which identifies a using the VLAN (802.1q) for a first IEC GOOSE Control Block from GSE-Section in ICD file. For detailed information see please IEC61850-8-1
VLAN ID	Hex/dec	From 0 up to 2^{32}	0	The parameter defines the unique identified of VLAN ID (802.1q) 0 - indicates that the tag header contains only user priority information, no VLAN ID. 1 - Default PVID value used for classifying frames on ingress through a bridge port. FFF - Reserved for implementation use.
VLAN Priority	dec	From 0 up to 7	4	The parameter defines the VLAN Priority as 3-bit binary number representing 8 priority levels, 0-7 (802.1q).
GOOSE Retransmission Strategy				
Default Step Delay	ms	0...65535	500	Parameter defines minimal timeout for IEC Goose service. Service function checks all changes in a poll of the Goose published Data Points and activates Goose transmission in any case. It activates retransmission even if the settings of retransmission strategies are not set.
Retransmission Strategy Type	list	<div> <div>geometric</div> <div>disable</div> <div>geometric profile</div> </div>	geometric (other name is arithmetic)	Selection of the Goose strategy type: arithmetic and profile.  "Disabled" option enables the application to send new GOOSE telegrams after changes or by expiring default step delay timeout.
First interval:	ms	0... up to 65535	1000	The parameter defines the first interval in milliseconds in arithmetic retransmission scheme.  Zero will be ignored and the application sets default value 1000 ms.
Multiple (arithmetic)	dec	0... up to 255	2	The setting defines the multiplier the for arithmetic retransmission scheme.  Zero will be ignored and the application sets default value 2.
Max Interval	ms	0... up to	4000	The setting defines the maximal interval in milli-

Name	Unit	Range	Standard value	Description
(arithmetic)		65535		seconds in arithmetic retransmission scheme.  Zero will be ignored and the application sets default value 4000 ms.
Number of Intervals	dec	up to 6	6	The setting defines a number of intervals in the profile retransmission scheme
Interval timeouts	dec	Up to 255	1000 1500 2000 2500 3000 4000	The intervals in milliseconds in profile retransmission schema. If any changes of Goose data occur, the application sends Goose data and then resets the retransmission time to value of first interval.

18.7.5 Subscribe Side

18.7.5.1 List of GOOSE light External Publishers

The application allows subscribing from 1 up to 16 external publishers as GOOSE partners for REG-PE / REG-PED. The external GOOSE *light* publishers are complying with a specification of REG-PE / REG-PED inner Subscribers.

The GOOSE *light* Subscribers List pane contains full information about the subscribed GOOSE streams:

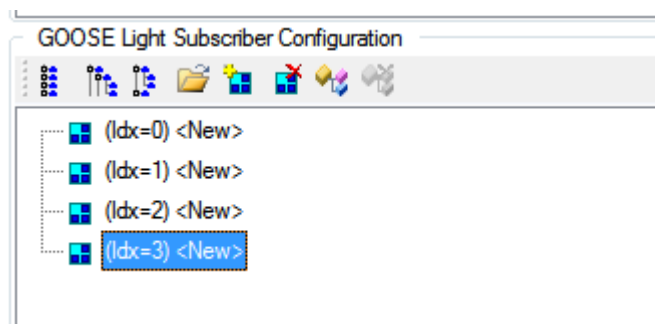

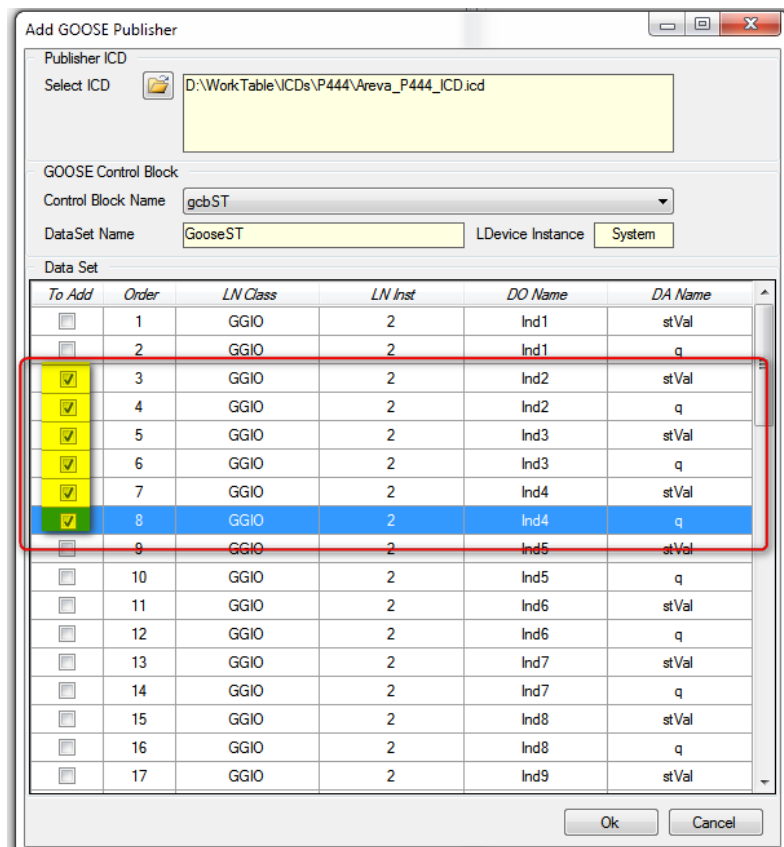

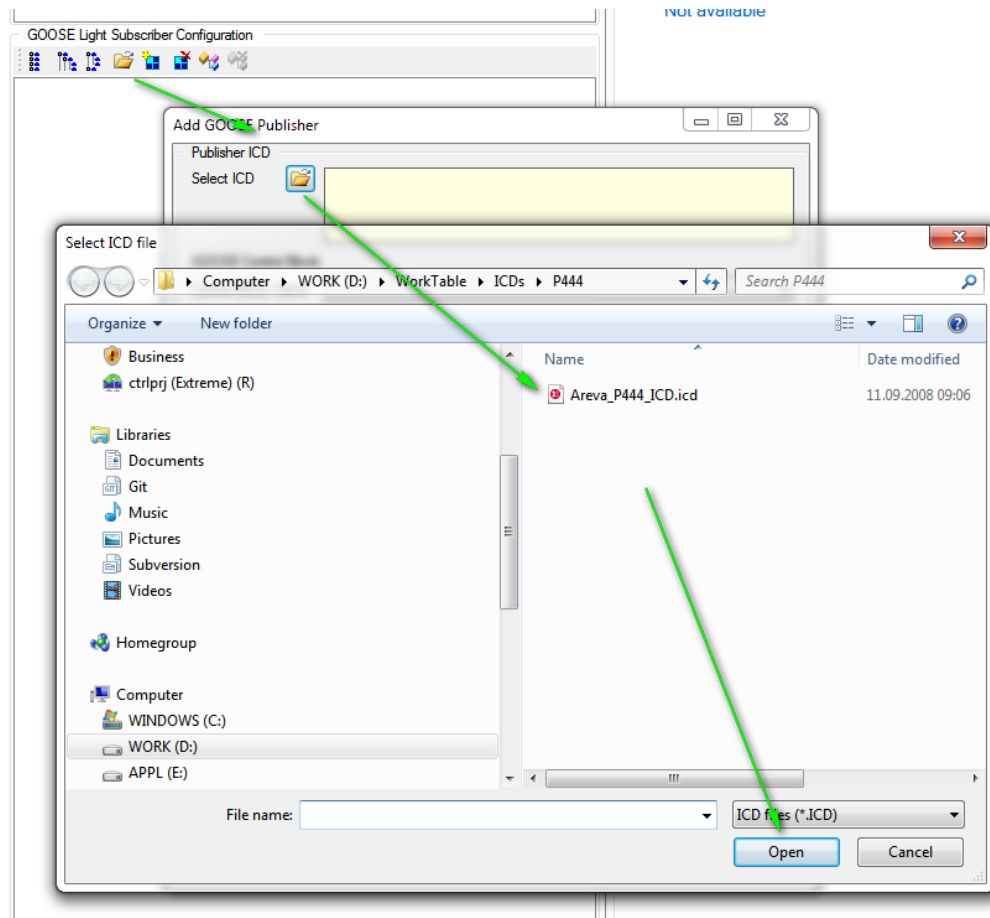

Figure 127: GOOSE light Subscribers pane

SCL_Config is able to create Publisher from ICD file, as shown below.

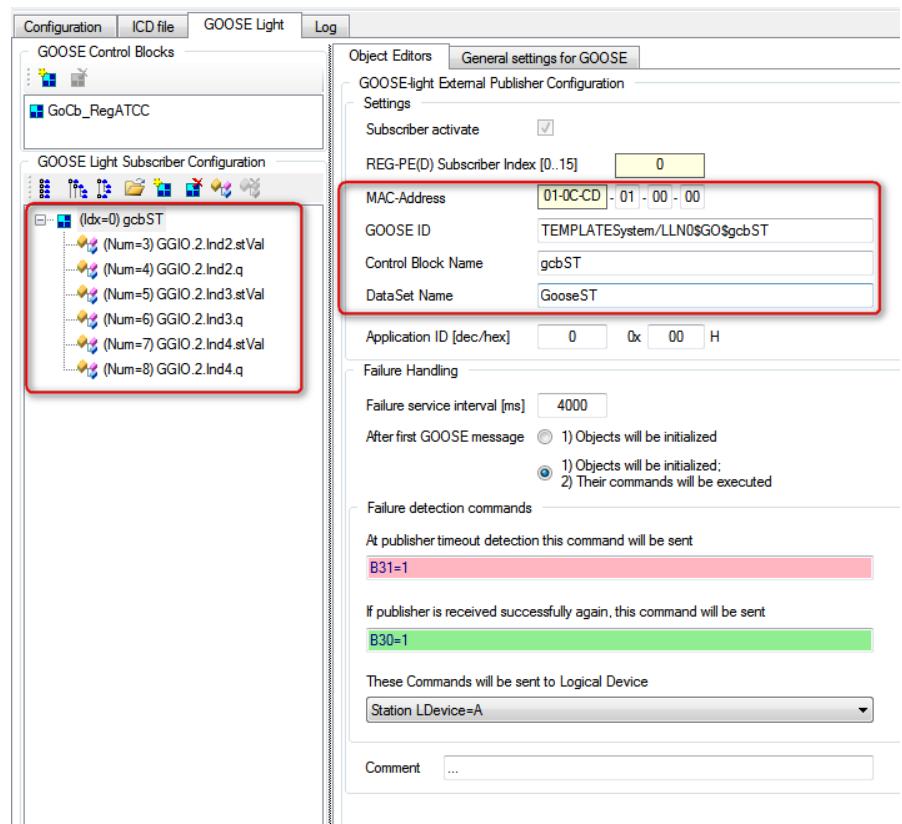

Figure 128: Add Subscriber from other ICD file

The detailed settings of one subscriber described below.

Table 59: GOOSE subscribed stream settings

Name	Unit	Range	Standard value	Description
Order No. (input number to select):	dec	From 1 up to 16	-	It defines selected number and used to quick select a subscriber.
Description				
REG-PE(D) Subscriber Index [0..15]:	dec	From 0 up to 15	0	Defines the unique index which operates as a primary key for the extern bonded objects. Read only parameter.
Subscriber activate:	check box	On/Off	off	It activates subscriber.
GOOSE MAC Address:	hex	6 octet	IEC61850-8	The parameter defines the multicast data link address of the IEC GOOSE Input telegrams.
GOOSE ID:	string	up to 64 symbols	Test_GoID_A	The parameter defines the GOOSE light identifier string of GOOSE input telegram. It shall be set identical to a unique identifier publisher.
GOOSE Control	string	up to 64	Test_GoRe	The parameter defines the full name of the Goose control block for IEC GOOSE Publishing without

Name	Unit	Range	Standard value	Description
Block:		sym-bols	f_A	MMS-Control Blocks. It shall have a unique name in one GOOSE.
GOOSE Data Set:	string	up to 64 sym-bols	Test_GoDs_A	The parameter defines the name of the dataset being sent in IEC GOOSE.
Application ID [dec/hex]:	Hex/dec	From 0 up 16383 (3FFF)	0x3ED or 1001 in decimal notation	The parameter defines the VLAN Appld, which identifies the application using the VLAN (802.1q)
Failure service interval [ms]	ms	0...999 99	4000	The parameter defines maximal timeout (ms) for the first message. It is used to set a maximum time to wait for the first message in a subscribed GOOSE <i>lightstream</i> . If an input GOOSE message is not received before the timer expires, the subscriber's alarm status value will be set.
After first GOOSE message:	list	list	executed	<div> 1) Objects will be initialized; 2) Their commands will be executed 1) Objects will be initialized 1) Objects will be initialized; 2) Their commands will be executed B30=1 </div> <p>The parameter defines the handling of first GOOSE telegram.</p> <p>1)After start-up of REG-PEX the process image will be filled with topical value. Only if the value changes it will be sent to eberle device. This makes sense e.g. at auto/man command.</p> <p>2)After start-up of REG-PEX the first reception of a GOOSE message will lead to an immediate command to eberle device. This makes sense e.g. at trip/close information of relays for programmer use, since the eberle device needs an up-to-date-information right from the beginning.</p>
Failure detection commands:				<p>Defines behaviour and commands in case:</p> <p>At publisher timeout detection</p> <p>If publisher is received successfully again</p>
<p>Failure detection commands</p> <p>At publisher timeout detection this command will be sent</p> <p>B31=1</p> <p>If publisher is received successfully again, this command will be sent</p> <p>B30=1</p> <p>These Commands will be sent to Logical Device</p> <p>Station LDevice=A</p>				
Comment	string	up to 64 sym-	Not default	User commentary for subscriber stream

18.7.5.2 Binding to External Inputs

0 List of GOOSE light External Input Objects

The application allows flexible to set properties of external Input Objects (partial data objects from a published GOOSE).

The GOOSE *light* External Input Objects pane contains the information about the subscribed objects and commands, which will be executed after any changing of object's value.

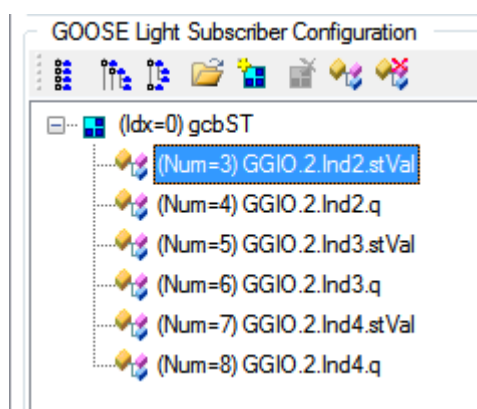

Figure 129: List of GOOSE *light* external Input Objects

0 Input Object Configuration

- ➡ Double click on an item "Object Configuration" in the left-hand menu.

➡ The GOOSE *light* Input Object Configuration pane contains settings of one object and allows to adjust it's for a particular structure of GOOSE telegrams.

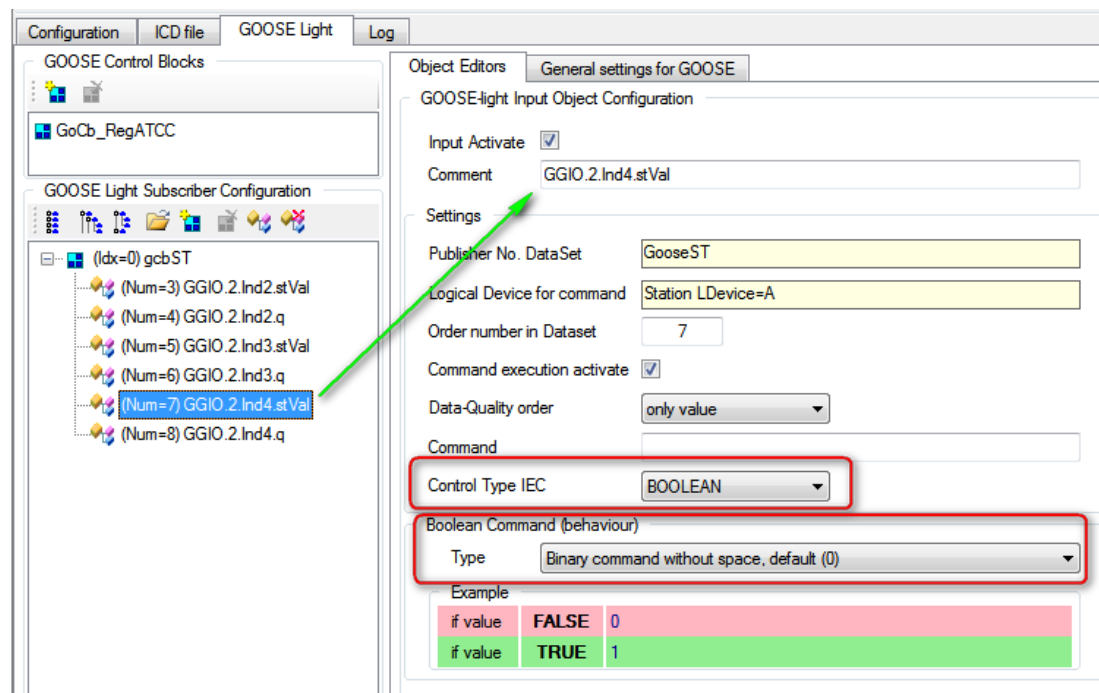

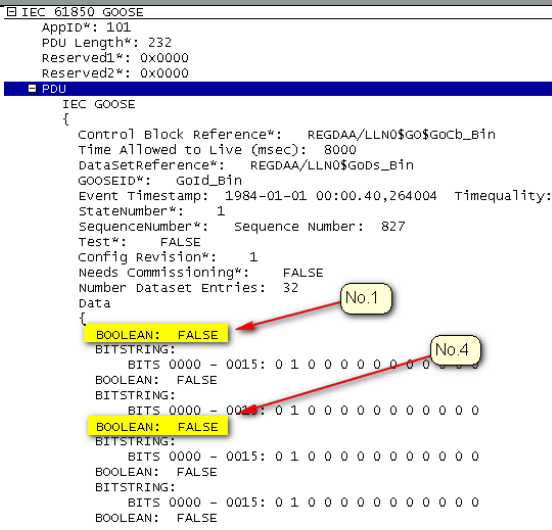

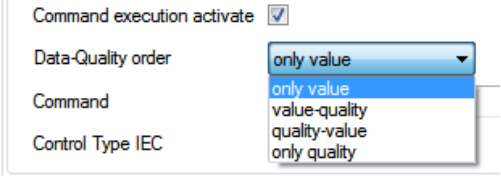

Figure 130: External GOOSE lightobject configuration.

Table 60: External GOOSE *lightobject* settings

Name	Unit	Range	Standard value	Description
Order No. (input number to select):	dec	Up to 300	1	It defines selected number and used to quick select a data object.
Description				
GOOSE ID and DataSet:	text	Drop down list with 16 subscribers	0	The parameter defines a subscriber which contains this data object.
Order number in Dataset:	dec	From 0 up to 300	0	The parameter defines an order number of the data object in data set. For more information see IEC61850 Standards.

Name	Unit	Range	Standard value	Description

Input activate:	string		checked	The parameter defines the use of the object. Parameter allows not delete set object from settings file, although it won't be used in firm-ware.
Command execution activate:	checkbox		checked	The parameter defines kind of handling of object in data set. If "not checked" will be set, the object will be passed for GOOSE command.
Logical Device for command:	string	Up to 64 symbols	A	It defines a name of Logical Device IEC 61850 in Structure "Server". The GOOSE command will be applied for defined device only. The name must contain no white space. The naming rules conform to IEC61850 part 6.
Data Type:	list	INT8 INT8U INT16 INT16U INT32 INT32U BOOLEAN DOUBLEPO ENUM	BOOLEAN	It defines the IEC61850 data type. For example, it has been marked on the screenshot above. All possible choices are listed in the drop-down list. For example, GOOSE bit string [10] can be executed as double point [2] command.
Maximal Value [ex. SP,DC]	float		1	Nowadays it isn't supported for GOOSE commands. The parameter is leaved only for compatibility with the previous versions.
Scale	dec	- 128...127	0	The parameter defines scale of command value. Normally, scale is used as exponent with single commands. If a Boolean or Bitstring IEC control data type is selected, scale has special meaning. (See following tables.). The parameter can be adjusted from -127...128. By default set to 0. Behavior and types of scale shown below
Command	string	REG-L command	B20=	Command string according to RGL-settings of REG-D™
Data-Quality	list	Values	Value-	The parameter defines a kind of quality rating of

Name	Unit	Range	Standard value	Description
order:		are listed in the pull-down list.	quality	<p>object in data set. Possible choices are listed in the pull-down list.</p>  <p>Executing types with quality enable to handle the object dependent on of their quality. The object with quality should be represented in GOOSE dataset as two-part data attribute with value and its quality (as Bitstring 13 [0000000000000]). The quality can be located instant before or after value data attribute.</p> <p>Only value: Command must be executed after change of object value, regardless of whether quality is invalid or valid.</p> <p>Value-quality (quality is located instant after value) Object will be accepted only, if its quality is valid. Object quality must be instant follow. If quality is valid and value of the object was changed, command will be executed. Otherwise object will be ignored.</p> <p>Quality-value (quality is located instant before value) Object will be accepted only, if its quality is valid. Object quality must be instant before value. If quality is valid and value of the object was changed, command will be executed. Otherwise object will be ignored.</p> <p>Only Quality Special type. It is used for handling of the quality triggering. If quality will change, a corresponded command will be sent to REGSYS.</p> <p>This type is applicable only for data type QUALITY.</p>
Comment	string	Up to 64 symbols	No	Commentary for configuration.

We take care of it.

Control Type IEC BOOLEAN

Boolean Command (behaviour)

Type Binary command without space, default (0)

Example

if value	Binary command without space, default (0)

18.7.6

18.7.7 Incoming Command Behavior

Command execution of GOOSE commands is different for floating and other types of dataset members. Firmware supports a check of dead band, the deviation from zero, range of values for floating types.

A processing diagram is shown below.

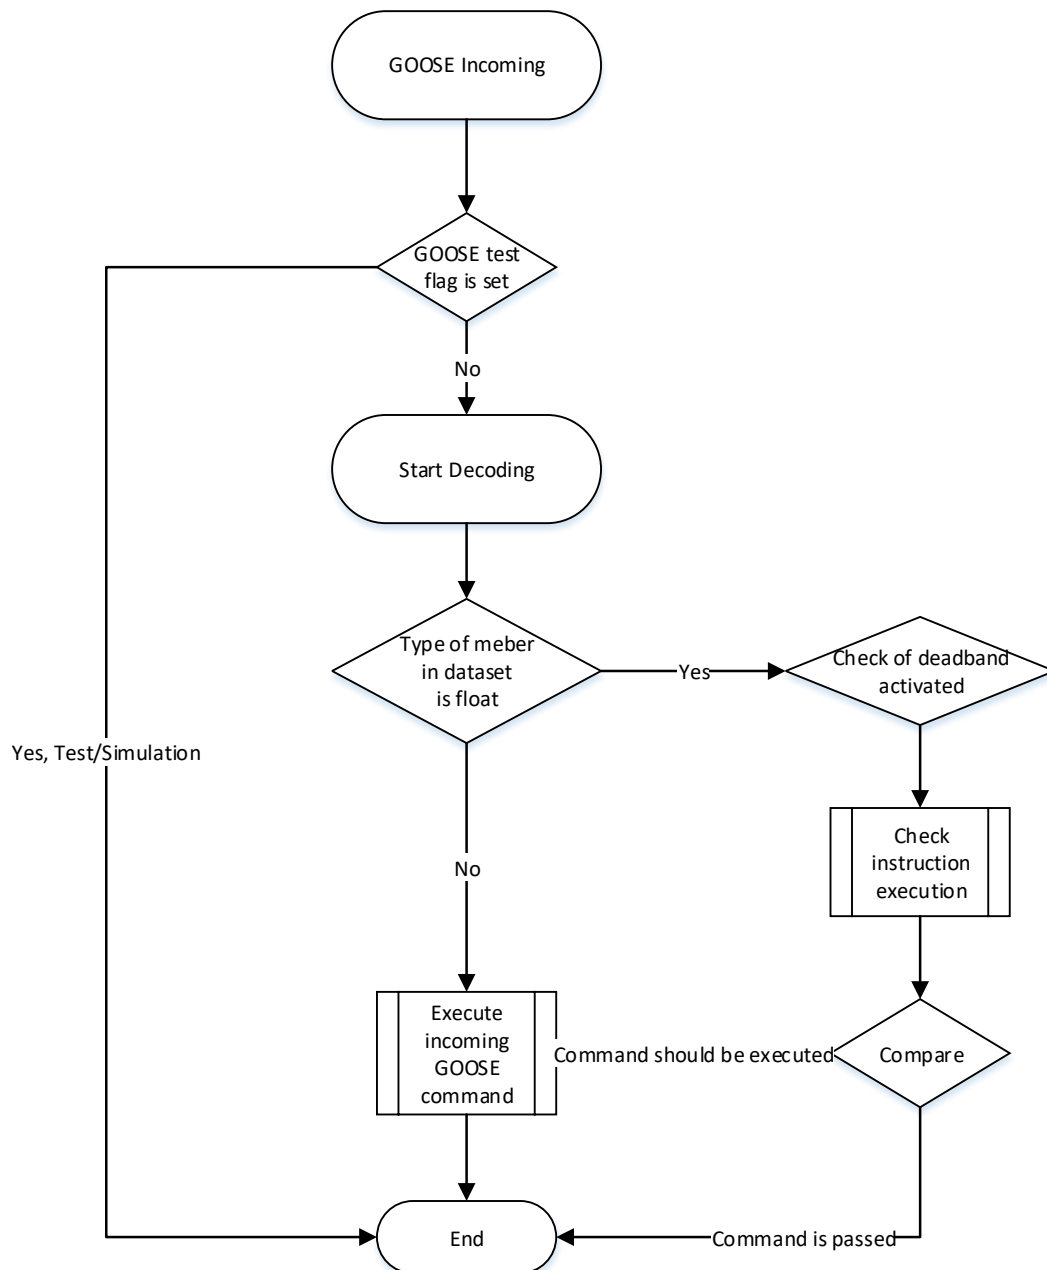

Figure 133: Execution of GOOSE commands.

The transmission status of the command will be checked before the execution only if that activated for this command.

A "deadband" section is shown on SCL-Config Input Object Configuration below.

18.8 Client IEC61850 Support

The firmware IEC 61850 is supplied with the internal functions of client IEC 61850. The internal client IEC 61850 can receive the defined up-to-date measures from protective device and a current position of a tap changer. A data using from tap changer is optional. On the contrary, the data from the protective device are mandatory in "Client IEC61850" mode of operation.

SCL-Config Tool contains all necessary settings for "Client IEC61850" mode of operation. The advanced facilities and settings are described below.

Figure 136: Profile for Client operation mode.

You can modify the client settings in the tab "Client IEC 61850". All the settings are collected here, from connect settings up to the settings of data handling.

We take care of it.

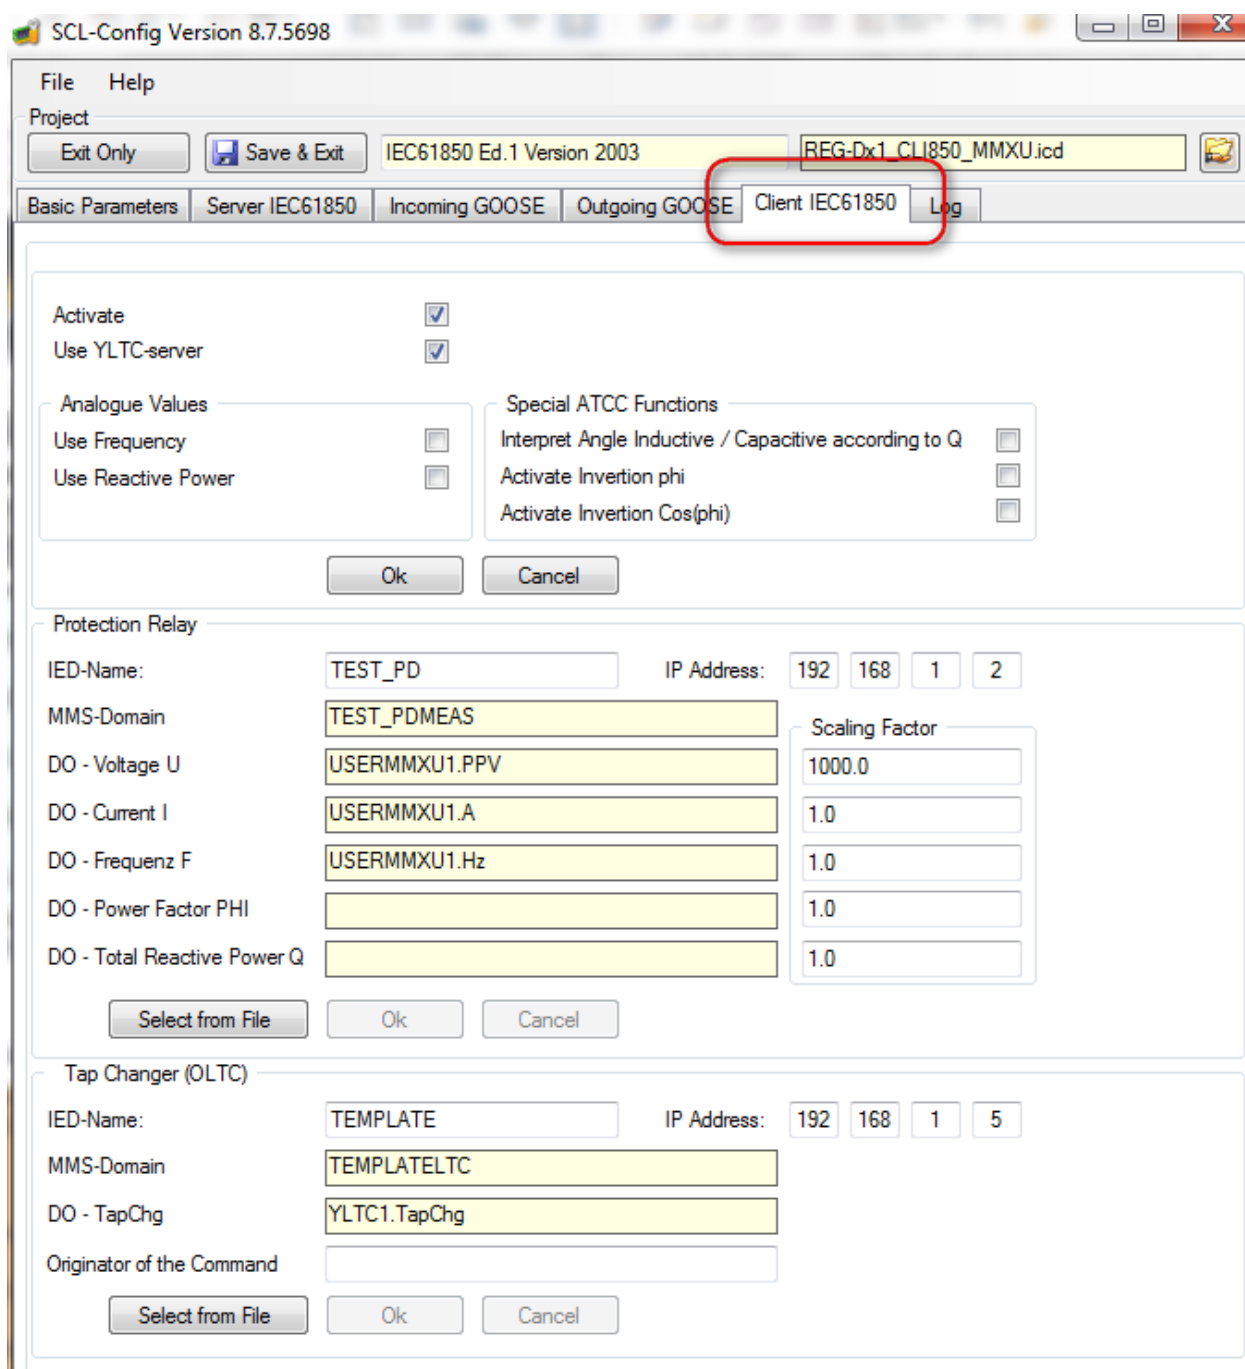

Figure 137: SCL-Config, Client IEC61850

Table 63: Client IEC61850 Support

Name	Unit	Range	Standard value	Description
Activate	Check -Box	On/off	Off	Activate of the client operation mode.
Use of YLTC-server	Check -Box	On/Off	Off	Define an operation mode with use of a tap changer position and transient mode
Analogue Values Group				Define an application the measured frequency and

Name	Unit	Range	Standard value	Description
				reactive power from protective device.
Special ATCC Functions Group				Adjusting of REG-D handling with received measures.
Protection Relay Group				All settings for protective device connection and data acquisition.
Tap Changer (OLTC) Group				All settings for protective device connection and data acquisition.

18.8.1 Analogue Values Group of Settings

Table 64: Analogue Values Group of Settings

Name	Unit	Range	Standard value	Description
Use Frequency	Check-Box	On/Off	Off	<p>This setting defines how to use a frequency measure (F) from protective device.</p> <p>0 ON – data object should be parameterized and is used in client operation mode. The measure will be transferred to REG-D;</p> <p>0 OFF - data object is not used in client operation mode.</p>
Use Reactive Power	Check-Box	On/Off	Off	<p>This setting defines how to use a reactive power measure (Q) from protective device.</p> <p>0 ON – data object should be parameterized and is used in client operation mode. The measure will be transferred to REG-D;</p> <p>0 OFF - data object is not used in client operation mode.</p>

18.8.2 Special ATCC Functions Group of Settings

By specifying these settings the following changes of calculation will occur:

0 For $\cos(\phi)$:

- $\cos(\phi) = [-1..0]$, $P < 0$ (output active power);
- $\cos(\phi) = [0..1]$ means $P > 0$ (effective power);

If active power direction does not correspond to REG-D setting, the active power measure can be inverted.

0 Interpret angle inductive / capacitive according to Q:

- ON - inductive load, the angle ϕ should be a negative value;
- OFF - capacitive loading, the angle ϕ should be positive value;

Inversion of the angle in the case of capacitive load, or always the case that $Q \geq 0$ is used for capacitive load. In general, the angle ϕ should be in the range from -180 to $+180$ degrees. Whereby angle from -180 to 0 degrees means the inductive load.

The case $Q = 0$ ($\cos(\phi) = 1$) may be occur. However, the angle $\phi = 0$ does no influence.

Table 65: Special ATCC Functions Group of Settings

Name	Unit	Range	Standard value	Description
Interpret Angle Inductive / Capacitive according to Q	Check -Box	On/Off	Off	Defines the interpretation of the angle inductive / capacitive according to Q: 0 ON - inductive load, the angle ϕ should be a negative value; 0 OFF - capacitive loading, the angle ϕ should be positive value;
Activate Inversion ϕ	Check -Box	On/Off	Off	Means the inversion of the power factor.
Activate Inversion $\cos(\phi)$	Check -Box	On/Off	Off	Means the inversion of $\cos(\phi)$.

18.8.3 Protection Relay Group of Settings

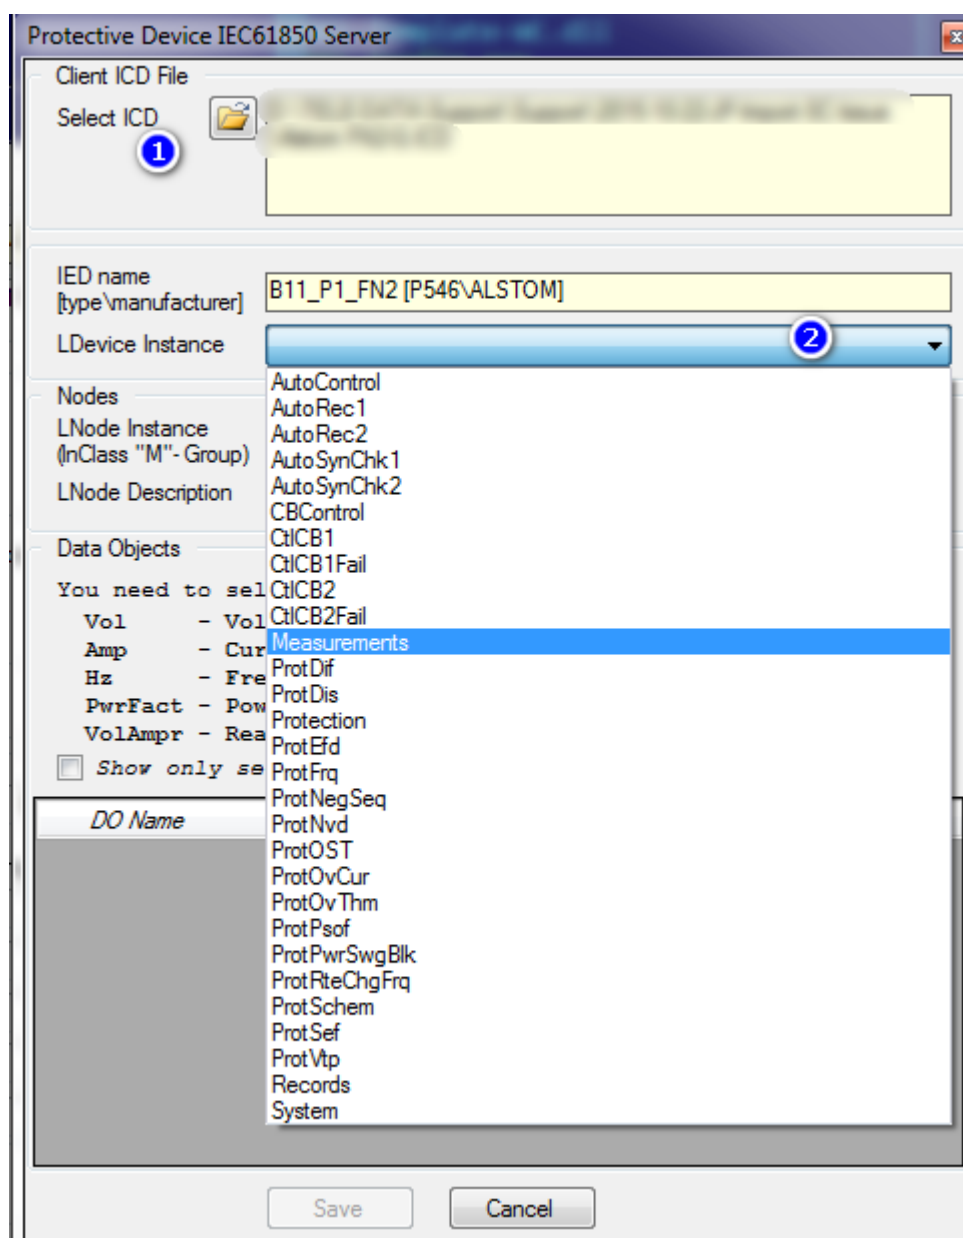

Table 66: Protection Relay Group of Settings

Name	Unit	Range	Standard value	Description
IED-Name	Text	According with IEC61850	TEMPLATE	IED name of the remote server
IP Address	IP address	RFC1006	0.0.0.0	IP address of the remote server
DO – Voltage U	Text	MMS path	Mandatory	Defines MMS-path to Data object. The value is read-only and can be adjusted only via "Select from File" facility
Scaling Factor	32-bit IEEE 754 floating point format.	floating point	1.0	Scaling recalculation factor for the measure value from server. If the factor is not equal to 1, the scale factor will be applied.
DO – Current I	Text	MMS path	Optional, empty	
Scaling Factor	32-bit IEEE 754 floating point format.	floating point	1.0	Scaling recalculation factor for the measure value from server. If the factor is not equal to 1, the scale factor will be applied.
DO – Frequency F	Text	MMS path	Optional, empty	Defines MMS-path to Data object. The value is read-only and can be adjusted only via "Select from File" facility
Scaling Factor	32-bit IEEE 754 floating point	floating point	1.0	Scaling recalculation factor for the measure value from server. If the factor is not equal

Name	Unit	Range	Standard value	Description
	format.			to 1, the scale factor will be applied.

18.9 WinConfig Settings

IEC61850 settings are available for TK860 and TK885D telecontrol boards.

Settings for IEC61850 protocol consists of XML template and corresponding ICD file. Both files are contained in WinConfig and corresponding ICD file is automatically selected together with IEC61850 template. Data points and commands are defined in ICD file.

ICD file editor SCL_Config is also part of WC. SCL-Config and WinConfig share the *IED name* parameter (Intelligent Electronic Device). SCL-Config can be run from the *Settings – SCADA* tree branch using the *Edit ICD file* button. IED name is automatically transferred back to WinConfig when edit in SCL-Config is finished.

18.10 Basic

The *Basic* tree branch contains basic settings for IEC61850.

18.11 Advanced

18.11.1 Settings - SCADA

Under this Item you can Export ICD-file. Default values should only be changed if you received an explicit instruction. During the System engineering phase some settings regarding the SCL ICD file might have to be adjusted (like the IED Server name for example.). This setting can be done offline with WinConfig.

The naming of the ICD-file is flexible. The import ICD-file with name xxx.icd changes SCL name in parameter from current name to xxx.icd.

Settings – SCADA tree branch shows information concerning IEC61850 protocol and allows TCP configuration. The button Export ICD file can be used for corresponding export and the button Edit ICD file runs the SCL-Config for ICD file edit.

18.11.7 Time synchronization

The NTP (Network Time Protocol) Configuration is used for time synchronization.

The SNTP client is implemented as a single thread which periodically requests NTP servers or listens for NTP broadcasts and Ipv4 multicasts, and optionally sends SNTP unicast requests to defined NTP servers. The SNTP-client will be automatically started by the start of the application, if it receives a list of NTP servers (main and secondary) from the sntp.param file. Otherwise time is not synchronized by the user with NTP- server.

REG-PE / REG-PED use these servers for installation of system time at real time.

The current SNTP settings provide one or two IP addresses of the NTP servers available for time synchronization. One server acts as primary server and the other as a backup server. The NTP servers must be listed in the order of preference. You can choose your preferred NTP servers (on default – *Main NTP server*). REG-PE / REG-PED analyses the availability of servers, their priority, and also their switching.

If the main NTP-Server does not work or is not defined, time is set by the secondary NTP-Server.

NTP-Servers provide first time synchronization at the start of the application. If your NTP-Servers support broadcast request-responses, a first time synchronization can proceed up to 10 seconds before.

Time synchronization

NTP specific
NTP primary server IP address: 192.168.1.140
NTP secondary server IP address: 192.168.1.5
Period between the attempts to set the clock: 16 sec
Max. timeout for the server response: 1 sec
Number of time samples in each clock cycle: 3 samples
Minimal time offset of clock relative to server: 0.000001
Scale for estimation of the NTP-offset worth: 1

DCF77 synchronization specific

DCF77: Version	-	-		DCF77: Version (Read only)
DCF77 clock activate	-	Radio button	No	DCF77 clock activate
Strategy of device time synchronization	-	Selection of check-boxes	Only attached device	<p>The Firmware includes a very flexible yet simple mechanism for time synchronization schemes for attached devices. There are three strategy types: all devices, only device, device-list and DCF77. The all devices scheme allows for a synchronizing of the all devices in E-LAN or per Time-Bus.</p> <p>The only device scheme allows for a time synchronization of the only first device. In standard settings a first device is master in E-LAN.</p> <p>The device-list scheme allows for a specific time synchronization of the devices specified in the "List of the synchronized devices" fields. Each field specifies the A-Eberle ID-device.</p> <p>The DCF77 scheme: the firmware sends DCF77 time to device, which can be set in 3 modes. The REG-L time synchronization command via COM2 is not used here.</p> <p>DCF77 device modes:</p>

Setting	Format	Range	Default	Description
				<p>SINGLE: via COM1/2 can be synchronized the system time in the DCF mode. The time synchronization bus is not supported.</p> <p>SLAVE: the time synchronization bus synchronizes the device system time.</p> <p>MASTER: device receives the time via COM1 in the DCF mode, the DCF signal is switched directly to the synchronization bus. Otherwise the device sends his system time as DCF telegram via the synchronization bus.</p>
Sync. period of connected devices	min	1 to 65535	5	<p>The parameter determines an interval time between the sequential time synchronizations by NTP servers. It is applied for the all attached devices according to the selected "Strategy of the device time synchronization". Value is configurable in the range 0...255. The default value is 5.</p>

18.11.7.1 IEC61850 time synchronization for TK28-4, TK28-6, TK102 boards

Time synchronization in IEC61850 for TK102 board utilizes also PTP (Precision Time Protocol) as time synchronization source.

PTP specific: Announce receipt timeout		0 to 255	3	Announce receipt timeout, all PTP nodes in network should have the same value
PTP specific: Sync. interval		Selection of values from listbox	none	Synchronization interval, 0 to 2

18.11.7.2 UTC-Settings by REG-Sys equipment

Connect the REG-Sys (REG-D, REG-DP, PQI-D and EOR-D) IED COM1 by using the delivered RS-232 Null Modem Cable with your PC. Use a terminal-program, e.g. WinReg, for the UTC-settings.

If the regulator has the station-ID A: you will see after pressing the ↵ button:

<A>

Afterwards you can take following time zone settings:

utcTZ	[= <time zone>]	Time Zone:	-12..0..+12 hours (part of an hour (e.g. 9.75)
utcDST	[= <use dst>]	Daylight Saving Time:	0=not used, 1=used
utcSH	[= <south hemisphere>]	Hemisphere:	0:north, 1:south

The system is now adjusted for correct time synchronization.

Example settings for Germany, time zone 1, daylight saving time and north hemisphere:

utcTZ = 1	TimeZone = 1
utcDST = 1	Daylight Saving Time = Yes
utcSH = 0	South Hemisphere = No

18.11.8 Internal communication

This tree branch contains settings concerning the internal communication between telecontrol board and the device.

Internal communication

Serial communication

Serial port:

COM2 ▾

Baud rate of device serial port [Bd]:

115200 ▾

Parity:

EVEN ▾

ON time of serial LEDs [ms]:

Command executed on startup:

Figure 150: IEC61850 Internal communication

Table 76: IEC61850 Internal communication

Setting	Format	Range	Default	Description
Serial port	-	-	COM2	Serial port for internal communication with device (read only). To change serial port go to Serial ports assignment tree branch
Baud rate of device serial port	Bd	Selection of values in combo box	115200	Baud rate of device serial port
Parity	-	Selection of values in combo box	EVEN	Serial port parity
ON time of serial LEDs	ms	1 to 65535	10	ON time of serial LEDs
Cycle time of poll	ms	0 to 65535	300	The parameter determines the cycle time of the substation call. If you set the parameter to zero, the call is executed as soon as possible. Value is configurable in the range 0...65535. The default value is 150.
Maximum timeout between sequenced ASCII-Data	ms	0 to 65535	800	This parameter specifies how long the program waits for sequenced next frame (data > 2000 Bytes) or the acknowledgement for command. The wait time is dependent on the baud rate and the maximum message length. Value is configurable in the range 0...65535. The default value is 800.
Cycle time of device status check	ms	0 to 65535	2000	This parameter specifies the cycle time with which the program checks the link status of the device is polling in the case of error in serial or frame. Value is configurable in the range 0...65535. The default value is 1500...
Number of repeats for SYNC cycle	-	1 to 255	2	Defines a maximal count of synchronization requests, if serial communication with XXXSysTM-Device fails. The parameter can be adjusted from 0...255. By default it is 2.
Number of poll repeats	-	0 to 255	1	Defines a maximal number of repetitions of one command. Default value is 2.
Round time down		checkbox	un-checked	If value equals "No", time stamps are rounded up in scale of one second to prevent time inconsistencies with substation. If value equals "Yes", time stamps are rounded down in scale of one second. Default value is "Yes".
RBAC timeout	s	30 to 600	300	RBAC timeout for RegSys firmware supporting user roles and rights and telecontrol boards TK8xx and TK102
Device IP address request repetition		0 to 65535	120	Defines number of polls after which IP-address, netmask and gateway are requested from a-Eberle device. They will be set then in the loader environment. The feature is supported only for REGSys devices.

Setting	Format	Range	Default	Description
				Value is configurable in the range 0...255. The default value is 0.
ACK standard timeout	s	100 to 65535	20000	Maximal waiting time of the changes caused by the command. Value is configurable in the range 0...65535. The default value is 8000.
SBO timeout	s	100 to 65535	30000	Maximal waiting time of the Operate request after receipt of a Select request. Value is configurable in the range 0...65535. The default value is 10000.
Command executed on startup	text	64 characters	empty	Command that will be executed once after startup.

18.11.9 Attached Devices

Special device settings are valid for each individual attached device. The default values must be adjusted to the respective device. A complete data record describes an attached device. Up to eight A-Eberle devices can be attached.

This tree branch contains specific device settings.

Device Request Settings

Identifier of device:

Poll string:

Size of answer [byte]:

Type of seconds field:

Offset of seconds field [byte]:

Type of msec field:

Offset of msec field [byte]:

Comment:

Figure 151: IEC61850 Device x

Table 77: IEC61850 Device x

Setting	Format	Range	Default	Description
LDevice Instance in ICD-file	text	Uppercase up to 10 char	no	The parameter defines device identification by its number. It must be the same as the IEC61850 Logical Device (LD) instance number (e.g., logical device name REG2 must have value 2 for "Device relocation").
Identifier of device	text	AA: or A(1 to 9): to Z(1 to 4):	AA:	The parameter defines an XXXSys™-Device name. The name should consist of 2 or 3 characters. A template of the name is: [A-Z] [empty or 0-9] [:]. (E.g., "F:" "A8:" "V7".) By default it is "A:" for regulators.
Poll string	text	24 characters	RPS 4	The parameter defines a poll string for a serial request. By default it is "RPS 4" for attached regulators, for other devices it is preconfigured in a different way.
Size of answer	byte	1 to 255	244	The parameter defines a size of answer corresponding to selected poll string.
Type of seconds field	-	Selection of values in combo box	Int32U	The parameter defines type of a second's value in defined poll string. Default value REGSys™ - "INT32".
Offset of seconds field	byte	0 to 255	18	The parameter defines the byte offset in defined poll string which includes a second's part of time. Default value is 18.
Type of msec field	-	Selection of values in combo box	Int32U	The parameter defines type of a milliseconds part of time in poll string. Default value for REGSys™ - "INT16".
Offset of msec field byte	byte	0 to 255	22	The parameter defines the byte offset in defined poll string which includes a milliseconds part of time. Default value is 22.
Comment	text	23 characters		User comment

18.11.10 Saving of settings in IEC61850

As the settings for IEC61850 protocol consist of XML template and ICD file, the Save selected settings to file icon offers separately saving of settings and saving of ICD file.

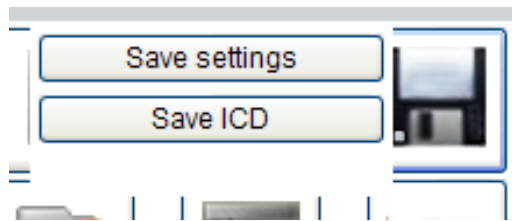

Figure 152: Saving of settings in IEC61850

18.12 MODBUS Collector

IEC 61850 comes additionally with Modbus-Collector-Functionality, which provides a MODBUS-RTU Master to retrieve information from Modbus-slaves to be processed in A-Eberle-device as well as being routed to IEC 61850 client.

The MODBUS Master can receive pre-defined analogue values from up to 32 MODBUS-RTU server and to be processed in A-Eberle devices. Usage of MODBUS-RTU using is optional. On the contrary, the MODBUS-RTU must be used only without activation of IEC 61850 Client or GOOSE incoming commands contemporarily on account of CPU load.

Basic settings tree branch form contains common settings of MODBUS-RTU.

Extended settings shall be done by A-Eberle staff.

MODBUS collector settings

Figure 153: MODBUS collector basic settings

Table 78: MODBUS collector basic settings

Setting	Format	Range	Default	Description
Activate	Checkout	Yes/no	no	Activate MODBUS-RTU extension.
Serial Port	-	Selection of values in combo box	COM1	Selection of available COM ports for MODBUS-RTU communication
Baud Rate	-	Selection of values in combo box	19200	Data transfer rate. 19200 b/s is default.
Parity	-	Selection of values in combo box	EVENT	Even parity is <u>required</u>
Stop bits	-	Selection of values in combo box	1	Stop bits
Data bits	-	Selection of values in combo box	8	Data bits
RS485 activated		checkbox	checked	Activation of RS485
Response timeout [ms]:	-	0..65535	200	The master is configured by the user to wait for a predetermined timeout interval (Response time-out) before aborting the transaction
Byte timeout	-	0..65535	0	The maximum timeout interval in ms. between two consecutive bytes of the same message
No reply	-	0..65535	0	Idle timeout after “no replay” from slave up to a next query.

Table 79: MODBUS collector slaves basic settings

Setting	Format	Range	Default	Description
Activate	Checkout	Yes/no	no	Activate MODBUS-RTU slave use.
Slave ID	-	1..254	1	Modbus slave address. The address must be unique on a MODBUS serial bus
Register address	-	2 Bytes 0x0000 to 0xFFFF	7000	The starting register address
Number of registers	-	1 to 500	6	The number of registers

18.12.1 Extended Settings in XML-file

The settings in XML file shown below:

```
<!--
Master Modbus settings
-->
<protocol type="modbus" activate="1">
  <!--
    device - Linux device - for Modbus
    tmo_resp - response timeout;
    tmo_byte - bit timeout;
    tmo_idle - idle timeout ( query interval for the slaves, those do not replayed )

    attributes are not shown in GUI :
      - tmo_master_interval - idle interval for master.
      - flowControl - serial flow control : 0 - off, 1 - hardware, 2 - software
  -->
  <params device="/dev/ttyS2" baud="19200" parity="2" rs485="0"
    flowControl="0" led_time="20" tmo_resp="200" tmo_byte="50"
    tmo_idle="4000" tmo_master_interval="250"/>
  <Slaves>
    <!--
      These attributes will be shown in GUI:
      - slaved - Slave ID
      - reg_address - register start address
      - reg_quantity - register quantity

      Other attributes are not shown in GUI :
      - reg_type -
        : 4 - read out input registers
        : 3 - read out holdings registers
      - Cmd - query measures (commands for REG-D).
        Number is variable.
      - db - dead band in %
      - type is float, int32, uint32
    -->
    <Slave order="1" activate="1" slaved="1" reg_address="7000" reg_quantity="6"
      reg_type="3">
      <Cmd activate="1" reg_address="7000" db="0.1" type="float"
        inverted="0" cmd="a1="/>
      <Cmd activate="1" reg_address="7002" db="0.1" type="float"
        inverted="0" cmd="a2="/>
      <Cmd activate="1" reg_address="7004" db="0.1" type="float"
        inverted="0" cmd="a3="/>
    </Slave>
```

Table 80: MODBUS-RTU extended settings

Attribute name	Format	Range	Default	Description
reg_type	decimal	3 or 4	3	3- Read Holding Registers 4 – Read Input Register
Cmd	-			Modbus command node in response.
db	Float	Float 32 bits	0.0	Dead band %
type	text	Float, int32, int32u	Float	Type of value
swapActivate	decimal	0..1	0	Activate swapping algorithm for 1 or 2 registers values from Modbus frame
swapByte	decimal	0..1	0	Value is swapped. 2 registers are used. <u>Bytes</u> swapped.
swapWord	decimal	0..1	0	Value is swapped. 2 registers are used. <u>Words</u> swapped.
cmd	Text	Text command	a1=	Command

18.12.1.1 Data Encoding

MODBUS uses a 'Big-Endian' representation for addresses and data items. This means that when a numerical quantity larger than a single byte is transmitted, the most significant byte is sent first. So for example:

Register size value

16 - bits 0x1234 the first byte sent is 0x12 then 0x34

32 – bits float 1000.1 will be sent as 44 7a 06 66

Or a capture a log from communication process:

	Alias	07000	004360-Rx:04 03 1B 58 00 06 42 AA
			004361-Rx:01 03 1B 58 00 06 42 FF
0		111.000000	004362-Tx:01 03 0C 42 DE 00 00 43 5E 00 00 43 A6 80 00 98 24
1			004363-Rx:01 03 1B 58 00 06 42 FF
2		222.000000	004364-Tx:01 03 0C 42 DE 00 00 43 5E 00 00 43 A6 80 00 98 24
3			004365-Rx:01 03 1B 58 00 06 42 FF
4		333.000000	004366-Tx:01 03 0C 42 DE 00 00 43 5E 00 00 43 A6 80 00 98 24
5			004367-Rx:01 03 1B 58 00 06 42 FF
			004368-Tx:01 03 0C 42 DE 00 00 43 5E 00 00 43 A6 80 00 98 24
			004369-Rx:01 03 1B 58 00 06 42 FF

Figure 154: Data Encoding

Examples for byte-ordering:

Modbus Byte-Ordering (Big-Endian)

Byte ordering for float 1000.1 : 44 7a 06 66

Byte ordering for float 111 : 42 de 00 00

Byte ordering for float 222 : 43 5e 00 00

Byte ordering for float 333 : 43 a6 80 00

IBM – Big-Endian:

Byte ordering for float 1000.1 : 44 7a 06 66

Byte ordering for float 111 : 42 de 00 00

Byte ordering for float 222 : 43 5e 00 00

Byte ordering for float 333 : 43 a6 80 00

INTEL – Little-Endian

Byte ordering for float '1000.1' : 66 06 7a 44

Byte ordering for float '111.000000' : 00 00 de 42

Byte ordering for float '222.000000' : 00 00 5e 43

Byte ordering for float '333.000000' : 00 80 a6 43

18.12.1.2 Adjusting Data Swapping

Data from Modbus slave may be swapped.

The swapping is activated in an attribute `swapActivate="1"`, if a value is 1.

The settings of the algorithm are adjusted in the following arguments:

- 0 swapByte: 2 registers or 1 register are used. If a value is 1, bytes in register(s) will be swapped;
- 0 swapWord: 2 registers are used. If a value is 1, words will be swapped.

F.e: Float value is: 230.55 or Hex value: 0x43668CCD.

Abbreviation for hex-form is: A=43 B=66 C=8C D=CD.

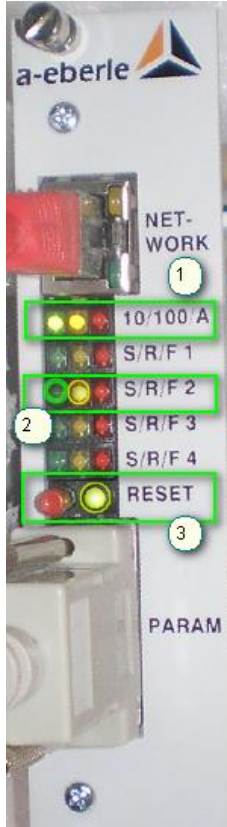

- 0 Swapping OFF: Float AB CD value will be parsed in floating point. 2 registers are used. Value=230.55 in Modbus;
- 0 Word swapped is ON: Float CD AB Value will be parsed in floating point. 2 registers are used. Value= -3.16258e-031;
- 0 Byte swapped is ON: Float BA DC Value will be parsed in floating point. 2 registers are used. Value= -2.94439e+008;

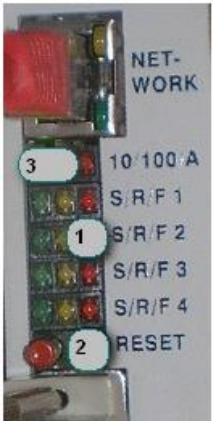

0 Byte and word swapped are ON: Float DC BA will be parsed in floating point. 2 registers are used. Value= 2.31163e+023;

19. Diagnostic Functions in the Context of the REG-P / REG-PE / REG-PED Device

The subject of this section is troubleshooting problems with the settings of REG-PE / REG-PED device and XXXSys™-Device interconnection.

Table 81: Diagnostic functions in the context of the device

LED's status of REG-PE/ REG-PED device	Indication
	<p>Normal operation:</p> <ol style="list-style-type: none">1. Indication of Ethernet activity, depends on current activity on Ethernet line2. Indication of communication on serial ports 1 to 4 (S – send data, R – receive data, F - error)3. Watchdog indication

	<p>Hardware or application fault.</p> <ul style="list-style-type: none"> ➔ First of all check please network connection and power supply. ➔ Then follow the instructions described above.
	<p>Communication REG-PE – REG-D™ faults.</p> <ul style="list-style-type: none"> ➔ Check please device settings ➔ Check communication settings of REGSys™ (baud rate, parity etc.)

Note:

If the problems persist, please ask your system administrator first. For further assistance please contact a.eberle product support at <http://www.a-eberle.de>
