## Position Indicator Interface Typ REG-FR 'B2'

The REG-FR resistance interface converts the position of a tap changer with resistor row into a BCD code for RegSys system. A build-in power supply supports the measure transducer, voltage outputs and relays.
Tap changer resistors (same values) will be connected to the measure input of REG-FR by only 3 or 4 wires. The resistor step value (Rs) of one of these resistors should be adjusted by potentiometer $R$ and will be displayed by a voltage measurement on both front connectors (range DC $5 \mathrm{~V}, \operatorname{Rin}>500 \mathrm{k} \Omega / \mathrm{V}$ ), with $0.1 \mathrm{~V} / \Omega$ at feature ' $\mathrm{R} 1 ; 0.5 \mathrm{~V} / \Omega$ at $\mathbf{~} \mathbf{R 2} \mathbf{;} ; 1 \mathrm{~V} / 100 \Omega$ at 'R3; $0.5 \mathrm{~V} / 100 \Omega$ at ' $\mathrm{R} 4 ; 0.5 \mathrm{~V} / 10 \Omega$ at feature 'R5 on display.

6 relay contacts ( NO contacts) and 6 current outputs make the BCD code available for further use.

- Up to 37 uniform resistor tap-change positions are converted into a BCD code
- 3- or 4-wire connection is applicable
- Up to 100 m distance between tap changer and REG-FR
- Contacts with AC 250 V 2A, DC 220 V 150 W
- Large auxiliary voltage range of the power supply

## Technical specifications

## Regulations and standards

IEC1010, IEC801-1 to 6, VDE0110, VDE0160

## Transfer behavior

By default the REG-FR is set to 3-wire connection and the tapchanger resistor to $10 \Omega /$ step at feature R1 ( $3.0 \Omega /$ step at feature R2; $100 \Omega /$ step at feature R3; $200 \Omega /$ step at feature R4; $30 \Omega$ /step at feature R5) adjusted. If a different adjustment value is required, please specify when ordering.

Cutting the wire on PC board and the wire between connector F2/11 and F2/12 activates the 4 wire resistance compensation. No measure current flows thru the tap switch and short disconnections will be suppressed.

| Deviating code table (max. 6 outputs) 4-wire compensation |  |  | Y99 | Specify deviating code table when ordering: Example: -9 ... -0 ... 19 |  |

The interface is also available in a 19" plug-in modules 8 TE 3 HE (feature B1) or panel mount case with display (feature B3). Further, interfaces with standard signal input $0 / 4 \ldots 20 \mathrm{~mA}$ or output codes such as BINARY, AWZ or GRAY-code are available.

Accessories: Control panel $96 \times 48 \mathrm{~mm}$ with 20 mm display

For longer distances between REG-FR and the step resistance Rs, the maximum cable length is less due to the DC resistance (see example), but rather determined by interference from parallel cables. A superimposed AC voltage up to 0.3 V at the REG-FR input is allowed. Each application has different earthing and voltage conditions. It can only be said in general, with shielded cables and greater distance to the parallel cables, a longer distance are possible.

Calculate example cable length $L \quad$ Wire Gauge 20AWG $A=0.5 \mathrm{~mm}^{2}$ (four-wire with each $\mathrm{d}=0.8 \mathrm{~mm}$, shielded) $R L$ line $=$ supply or return line $=12 \Omega \quad$ rho $C U 0.02$ for solid wire $\quad L=R \times A / r h o=12 \times 0.5 / 0.02=300 \mathrm{~m}$ $12 \Omega 0.5 \mathrm{~mm}^{2}$ results 300 m wire length. The interface can compensate the DC resistor of this wire. No interference was considered.
Adjust step resistance Rs with the front panel potentiometer R to $\pm 0.2 \%$ accuracy. Is the Step resistance not exactly known, an LED in the '+' measuring socket indicates the respective step centre.
When the step resistance Rs $>100 \Omega /$ step, the 2 -wire circuit can be used. For this case, bridge pins F2/ 6d - 8d and F2/2d - 4d.
If a different code table is needed, please place this when ordering. Example: -9 ... -0 ... 19
A subsequent change via solder bridges is possible. There is a separate description on request available.
